General description

The **IR2-202 COMBO** transmitter is used to transmit radiophonic signal for FM stereo sound broadcasting, operating in the Band II or Band I (OIRT), with 2kW output power capability and built-in exciter.

The equipment is fully compliant with the personnel safety requirements as specified in EC 215.

The transmitters is fully integrated in a compact 19" housing and is designed to offer high performances , high reliability and great simplicity in operation and maintenance procedures.

Key Features

- **BROADBAND** frequency synthesizer, without any other tuning or alignment.
- **MONOPHONIC & STEREOPHONIC** emission according to the CCIR rec. 450-2 standard.
- **RDS & SCA** subcarriers input capability
- **Hi-Fi-quality** modulated signal, with low residual noise and distortion.
- **AES-EBU digital interface** available as option
- **RF Signal** free from spurious and harmonic signals
- **LD-MOS** to obtain wide band , reliability , and high efficiency.
- **Dual 1.1kW** RF power amplifier
- **Dual 1.6kW** AC/DC Power supply
- **Dual Drive ; 1+1 ; N+1** Redundancy configuration capability
- **High Tolerance** mains voltage ($\pm 20\%$) is accepted by the transmitter
- **Remote Operation** compliant to IEC 864-1 rule ,
(Complete Remote Web Gui interface and SNMP options are available)
- **Control System** complete electronics adjust microcontrolled including fault finding
- **PROTECTION AND CONTROL SYSTEMS**
 - Block against emission on spurious frequencies
 - Reflected power
 - Modulation limiter
- **Air cooling system** fully integrated by means of three high reliability fans
- **Compact design** only one 19" rack 2 unit height is used

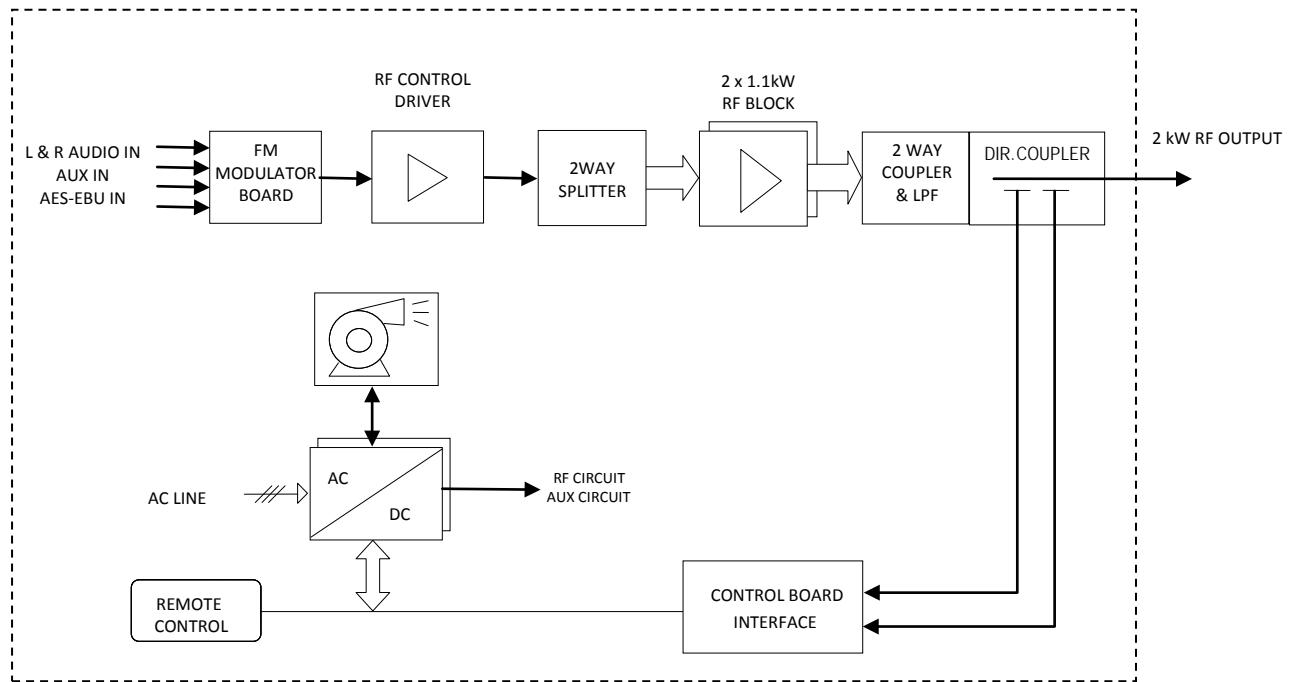

Functional Description

The functional description of the IR2-202 COMBO is made here below with reference to the Diagram shown in Figure 1.

The Stereo Sound signals and other input signals as RDS , SCA are applied to the I/O connector ass'y , present on rear panel .

The RF output signal from the Exciter is amplified , by means of a low power driver and applied to the Two Way Splitter which divides the signal in order to send it to the 2 RF amplifiers final amplifiers.

The RF output signals, coming from the two RF amplifiers , are then combined by the Two Way Coupler and then it is sent to the output through the Directional Coupler which provides a part of the Direct and Reflected Power measurement.

IR2-202 COMBO - block diagram

- Wide-Band Amplification

The RF amplifier is made up by two RF modules (pallets) installed in the shelf , the modules are dedicated for the Sound FM carrier amplification.

The nominal output power for each module is 1.1 kW ; the amplifiers employ solid state LD-MOS technology in order to obtain wide band , reliability , and high efficiency

- Flexible Cooling System

Is performed with forced air by means high reliability fans speed controlled , installed in the rear panel. The cooling system in fully contained in the transmitter.

- Power Supply

The power supply unit is realized with two independent AC/DC modules easy accessible .

Each AC/DC module has an individual protection against over-current and temperature , so that any failure occurred cause only a reduction of RF power , without service interruption.

The high tolerance mains voltage ($\pm 20 \%$) is accepted by the transmitter , so in most situations , the Automatic Voltage Regulator is even not necessary.

- Easy Operation and Maintenance

The control system includes a fault finding for detecting equipment malfunctions and locating the faulty subassembly which need to be replaced; the basic controls as Start - Stop - Standby - Reset and power readout are permanently available.

- Control System

Visual mode display is designed to allow readings of numerous important parameters of the Transmitter. It is possible to visualize parameters and other stored data without making changes while Transmitter is operating normally. Visual mode is intended for consultation only and therefore described first in the sequence

Visual/Program/Special modes. To ensure optimum reading the LCD is placed in the front panel, it contains two rows holding sixteen characters and visualizes the information listed below by simply rotating the encoder.

- Interlock

The interlock circuit is independent of the of the control system and remains always operational by means of the hardware wire.

Technical specifications

GENERAL

- Frequency range 87.5 to 108 MHz
- Class of emission F3E (Monophonic)
- F8E (Stereophonic)
- Stereo system According to C.C.I.R. rec.450-2
- Frequency deviation ± 75 kHz nominal
- Frequency control Built-in Frequency Synthesiser
- Resolution 10 kHz step programmable
- Frequency stability ± 500 Hz / 6 months
- Output power 2 kW (0.5 to 2kW adjustable)
- Harmonic emission ≤ 70 dBc
- Spurious emission ≤ 90 dBc
- Residual AM noise level ≤ 60 dB
- Synchronous AM ≤ 50 dB
- RF output impedance 50 Ω (7/8" EIA connector)

ENVIRONMENTAL

- Operating temperature – 5 °C to 45 °C
- Relative humidity 20% to 90% non-condensing
- Altitude up to 2500 m.

PROGRAM INPUT

- Mono/Stereo L & R program input
- Connector XLR type
- Impedance 600 Ω balanced
- Level – 4 to 12 dBm
- Preemphasis 50 or 75 µs selectable
- Audio frequency response 40 to 15000 ± 0.3 dB
- 19 kHz suppression ≥ 50 dB
- RDS and AUX Subcarrier program input
- Connector BNC
- Impedance ≥ 2 kΩ unbalanced
- Frequency range 67 to 100 kHz
- Nominal input level – 10 dBm (± 7.5 kHz deviation)

TRANSMISSION CHARACTERISTICS

Mono operation ± 75 kHz deviation

- Total harmonic distortion ≤ 0.1%
- Intermodulation ≤ 60 dB
- Signal to noise unweighted ≥ 80 dB
- Signal to noise weighted (CCIR 468-3) ≥ 78 dB

Stereo operation ± 75 kHz deviation

- Total harmonic distortion ≤ 0.1%
- Intermodulation ≤ 60 dB
- Signal to noise unweighted ≥ 78 dB
- Signal to noise weighted (CCIR 468-3) ≥ 72 dB
- Crosstalk L & R (40 to 15000 Hz) ≥ 50 dB
- 38 kHz subcarrier suppression ≥ 50 dB
- Attenuation above 53 kHz ≥ 50 dB

METERING

The following parameters can be read on front display

- Forward power (FWD)
- Reflected power (REF)
- DC Supply voltage
- Frequency (active channel)
- Frequency (stored channels 1 to 6)
- Mono and stereo sensitivity (0,25 dB step)
- Programmed output power
- MPX peak modulation
- L & R peak level
- RDS, SCA, Aux, MPX external modulation
- Programmed audio parameters (+L or -L, +R or -R, L on/off, R on/off, Pre-emphasis lin, 50, 75 µsec, Limiter on/off, Input Impedance Z=10kOhm/ 600 Ohm)
- Alarm status
- Memory status
- Internal voltage
- Serial Number

REMOTE CONTROL

Parallel interface: start, stop, standby, alarms,
status, interlock, recall memory

WEB interface: TCP/IP Telemetry/SNMP (option)

GENERAL

Voltage power supply: 220 V AC ± 15 %
(other on request)

Frequency: 50 - 60 Hz ± 5 %

Power consumption
(cooling system included) : ≤ 2.8 kW

Power factor: ≥ 0.9

Cooling: forced air

Dimensions: 483 x 88 H x 674 mm

Weight: 14 kg approx.

OPTION

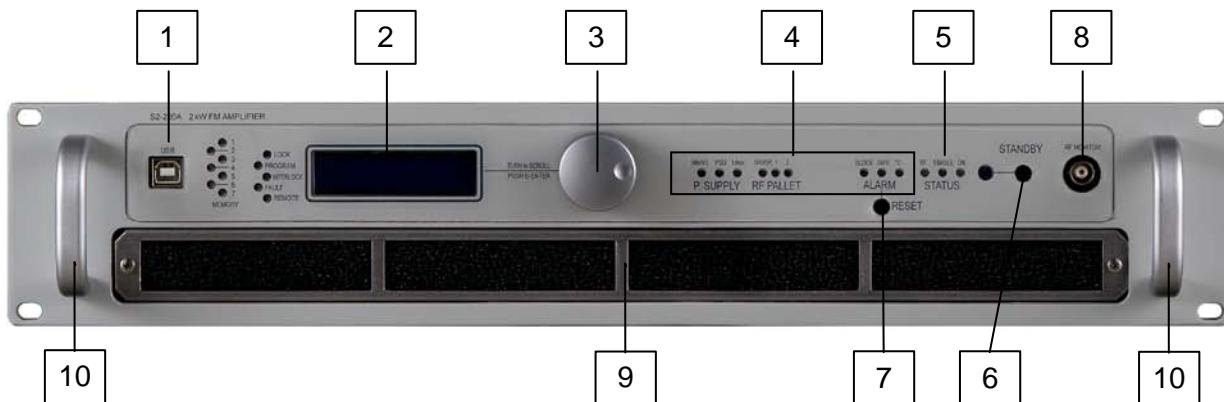

Digital audio Input: AES-EBU facilities XLR balanced (S/PDIF)

RDS : RDS simple coder programmable via PC

OIRT Version: band of frequency 65.80 to 74.00 MHz

Installation Requirement

This section explain how to install and configure the apparatus for your location. All internal switching and set-up should be done by qualified service person.

Parameter	Requirement			
Installation Area	It must be clean and free of dust , the transmitter must be installed to have space around enough for ventilation and for maintenance actions to be allowed. The minimum requirement space for transmitter must be : 1 x 2 x 2 (H) meter			
Temperature	Room temperature does not exceed : - 5 to 45 °C			
Electrical Plant	The main power installed must be : ≥ 3.5 kVA			
Feeder line	EIA 7/16" Coaxial Cable			
Antenna System	It must be 50Ω with Return Loss : ≥ 20dB at working frequency			
Main Voltage	AC voltage must be : Nominal value ± 15 %			
Main Power cable size (mm ²)	Operation voltage	Phase wires	Neutral wire	Protection earth wire
	208 to 240	≥ 15	not used	≥ 15
Air Cooling	If the transmitter is installed without inlet air duct the room must be capable of : 1500 m³/ h air flow			

2. Installation Procedure

TABLE OF CONTENTS

- Amplifier Arrangement
- Antenna Feeder
- Wiring the Amplifier
- AC Voltage Set-Up
- Electrical Interface
- Remote Operation
- Put in Operation

- **Amplifier Arrangement**

Install the amplifier drawer inside the own slot , make attention to insert on the left and right bracket , mounted before. Then push kindly the module by means the handles, until the complete insertion in the slot.

Complete the drawer fixing , with four M5 screws insertion on front panel and locks it to the rack mountings.

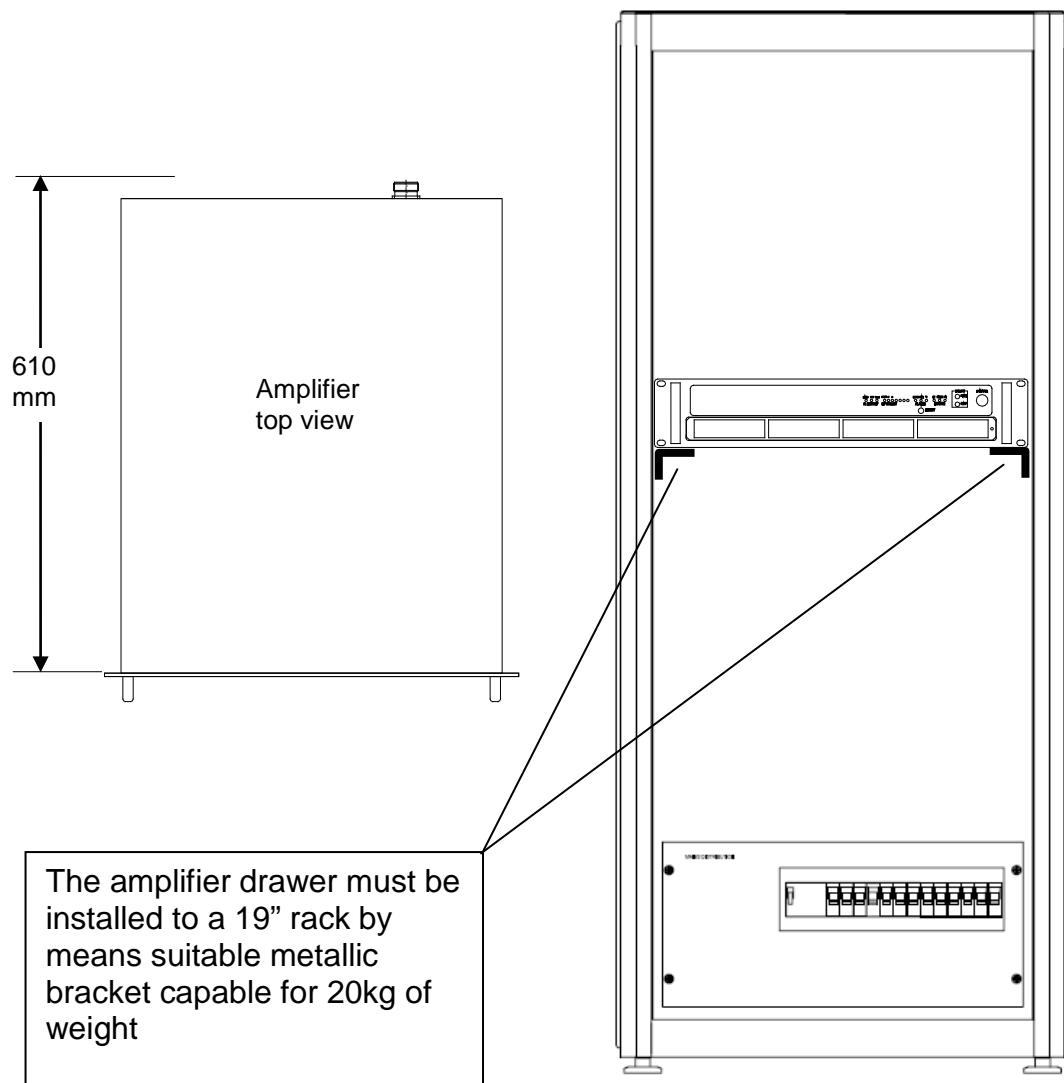

Fig.1 Typical amplifier arrangement inside rack

- **Antenna Feeder**

The Amplifier RF output interface is EIA 7/16" , others interface can be supplied on request in order to match the antenna feeder and RF output.

Before connection operation check the RETURN LOSS of the antenna system , it must be ≥ 20 dB at all working frequency.

- **Wiring the Amplifier**

Grounding

The equipment must be grounded by a suitable wire connected to the AC Mains Power Input Connector supplied.

Additional grounding wire can be connected to the proper terminal screw present in the rear panel .

SAFETY INFORMATION

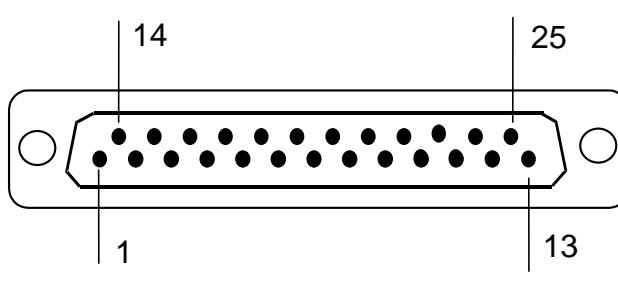

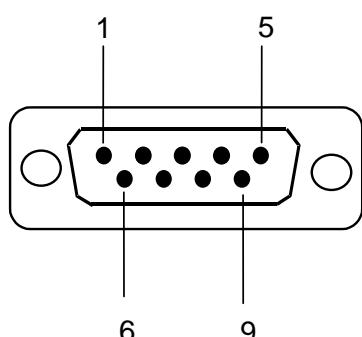

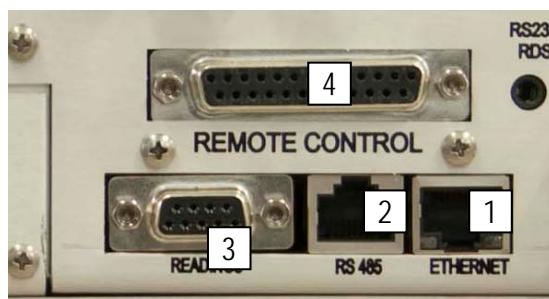

WARNING 208 - 240 VOLTAGE

Do not perform internal service or adjustment of this product unless another person capable of rendering first aid and resuscitation is present

- **Electrical Interfaces**

The electrical interfaces are available in a connector DB25 female installed in the rear panel rack drawer, the circuit provides to connect the transmitter with Remote Controls.

- 1) RJ45 for TC/IP Connection (Optional)
- 2) RJ45 for RS 485 Connection
- 3) DB9 connector Readings
- 4) DB25 Connector - Remote Control

Remote Operation

A remote control facility for the operation and maintenance of the transmitter is available, this can provide the full management , diagnostic and status of the equipment.

INTRODUCTION & GENERAL INFORMATION

About This Manual

A step-by step guide to simple installation and setup of Transmitter ,the manual contains the following sections:

- 1. Introduction & General Information:** current section
- 2. Visual Mode:** how to read main parameters and settings (consultation only)
- 3. Program Mode:** how to program main parameters and settings
- 4. Service & Maintenance:** component location, and other technical information

Symbols

This section contains a list of most commonly used symbols.

It is important to become familiar with symbols to understand the information contained in the manual. Additionally, some graphical signs are used to draw further or extra attention to specific operations.

This manual is divided into two main sections: use of equipment and maintenance. The two sections are separated by one blue page. The operator who has experience in using the equipment must not try to perform any maintenance operation.

Any incorrect operation may cause damage to electronics and be also potentially dangerous for operator's safety.

This symbol means: "Notice"

This symbol means: "Read carefully before operating"

This symbol means: "Please contact Manufacturer"

This symbol means: "Information relevant to the Software"

This symbol means: "Maintenance Procedure"

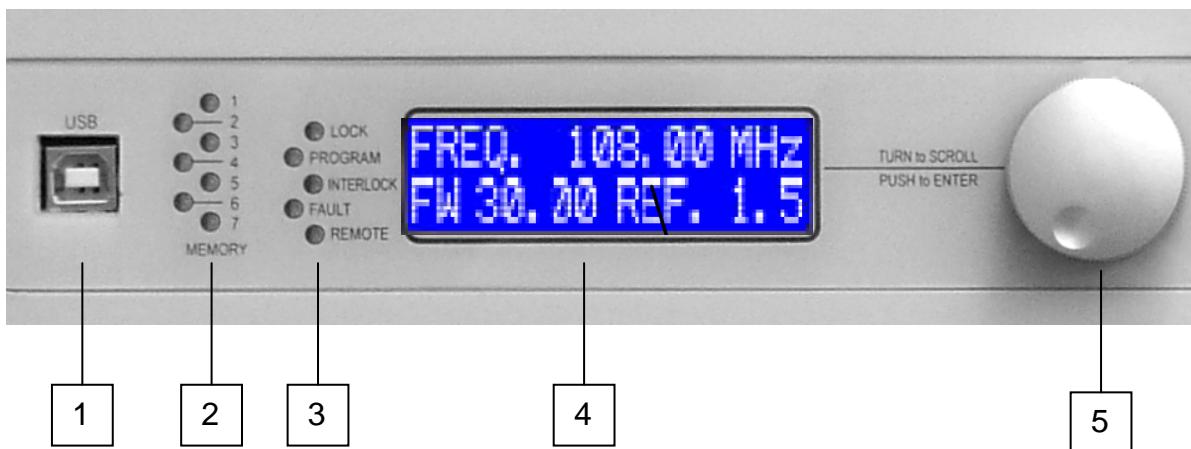

This symbol means: "DANGER!"

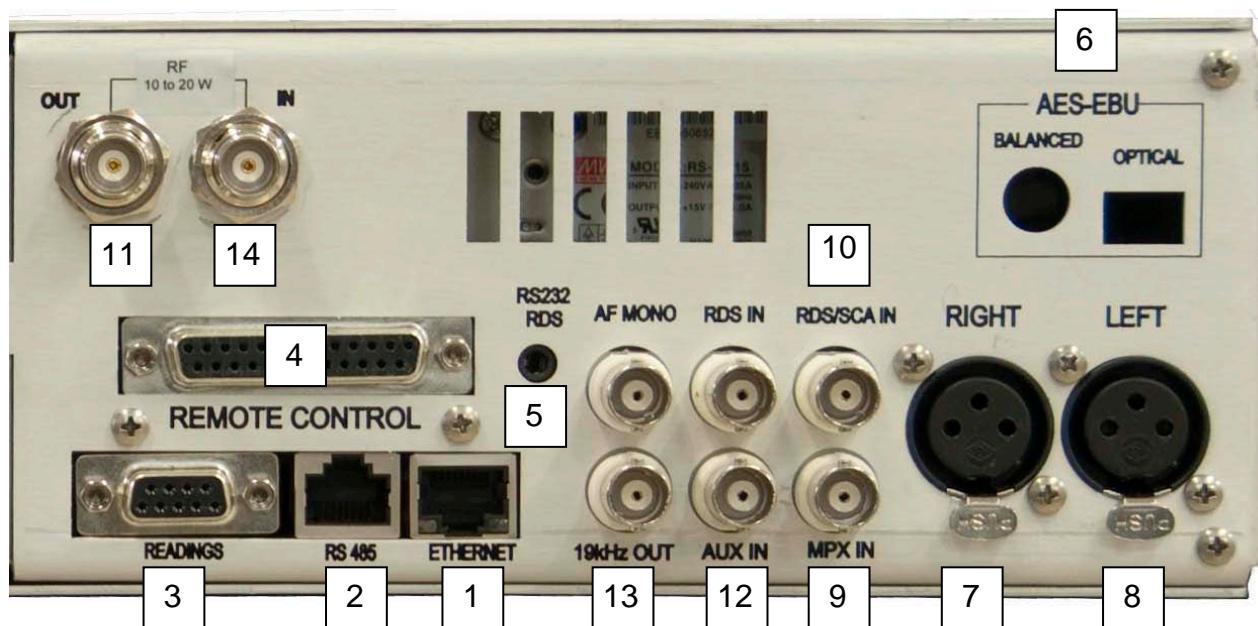

Meter Readings

The following parameters can be read on front display

- Forward power (FWD)
- Reflected power (REF)
- DC Supply voltage
- Frequency (active channel)
- Frequency (stored channels 1 to 6)
- Mono and stereo sensitivity (0,25 dB step)
- Programmed output power
- MPX peak modulation
- L & R peak level
- RDS, SCA, Aux, MPX external modulation
- Programmed audio parameters (+L or -L, +R or -R, L on/off, R on/off, Pre-emphasis lin, 50, 75 µS, Limiter on/off, Input Impedance Z=10KOhm/ 600 Ohm)
- Alarm status
- Memory status
- Internal voltage
- Serial Number

OUTPUT	
Pilot	BNC connector 19 kHz Square wave, level 1 Vpp, impedance >5kΩ, unbalanced type

Description of the Encoder Knob

The **encoder knob** located on front panel is the main access to control transmitter in conjunction with display readings. It rotates clockwise or anticlockwise, and can be pushed. The overall procedure to browse through the different menus is very intuitive.

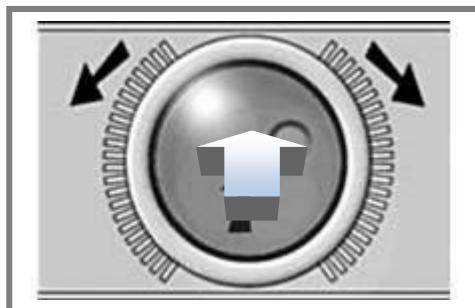

The LCD display shows **two rows with sixteen characters** and a number of different menus. Three operating modes are possible:

- visual only mode:* it reads set values or parameters
- program mode:* it sets up parameters and/or other values to modify
- special program:* it resets power and upgrades firmware

In all cases when turning the encoder knob and the indication “**Push to Program**” appears on display it is possible to modify parameters. This simple message “Push to Program” is the basic way to select and store.

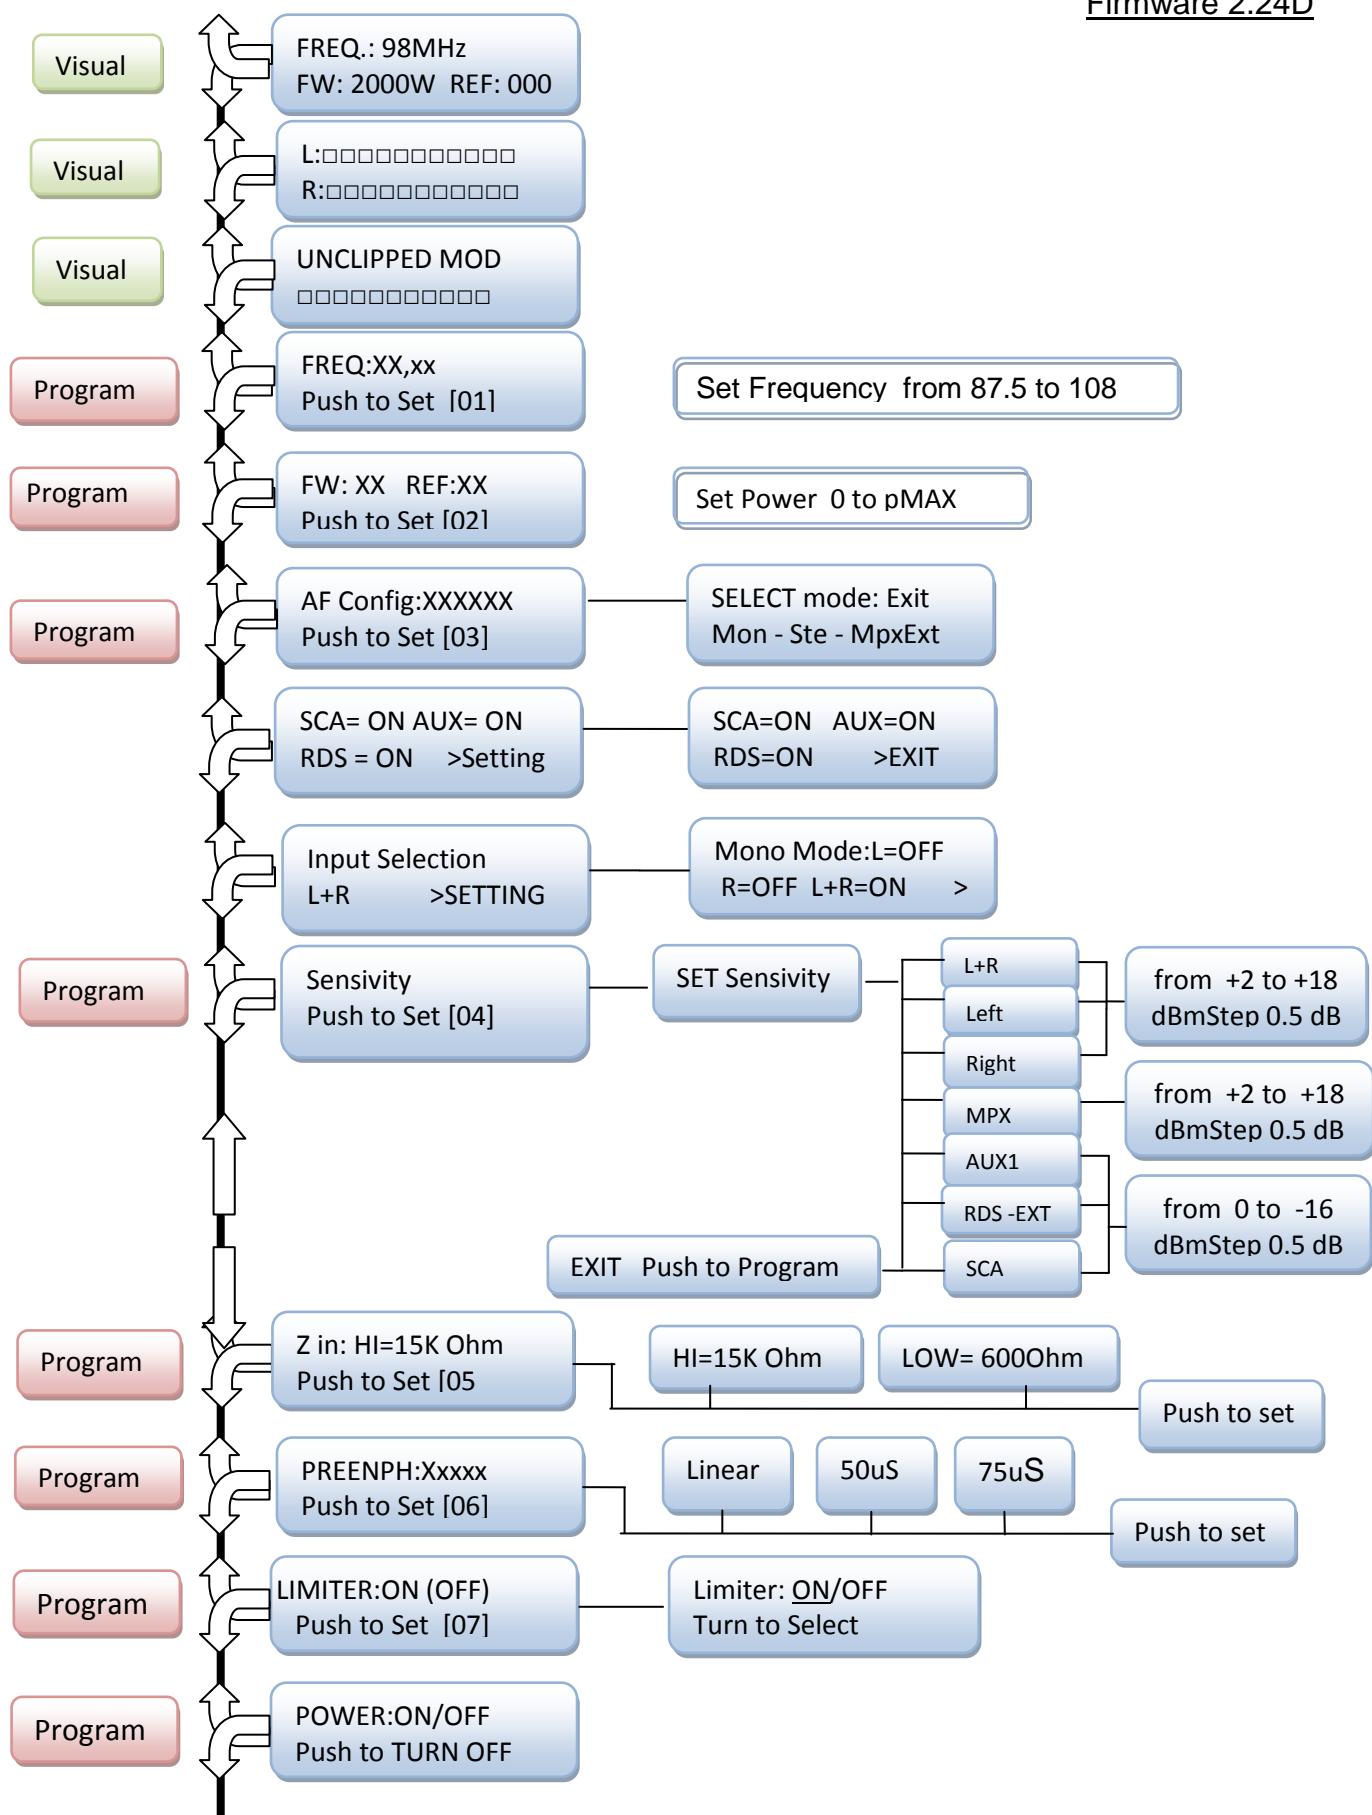

A description of all available menus displayed on the LCD is reported in the following sections. It is important to remember that:

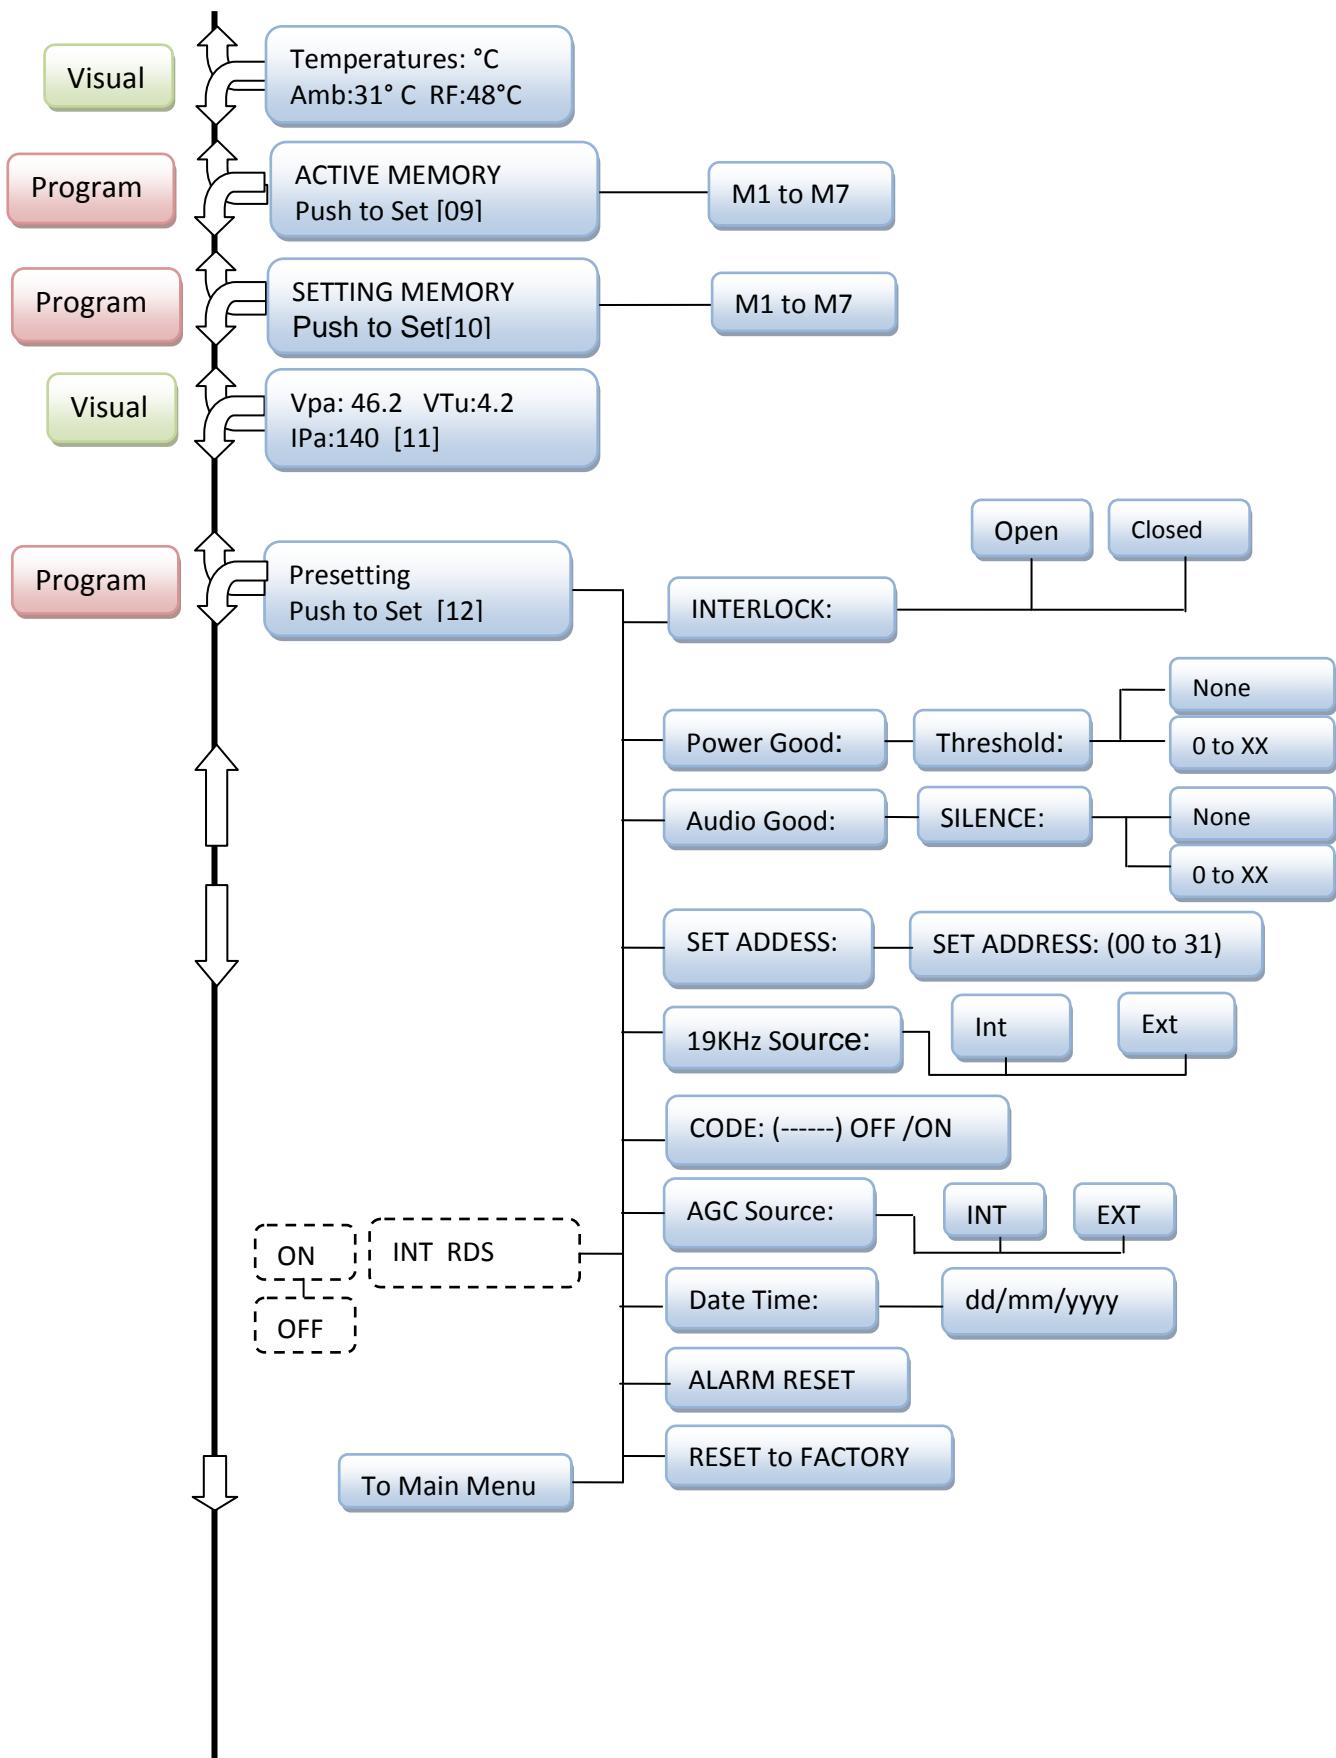

- By rotating the knob:** you scroll the sub-menus, increase or decrease a given value
- By pushing/pressing:** you select parameters to modify you store values and confirm selection

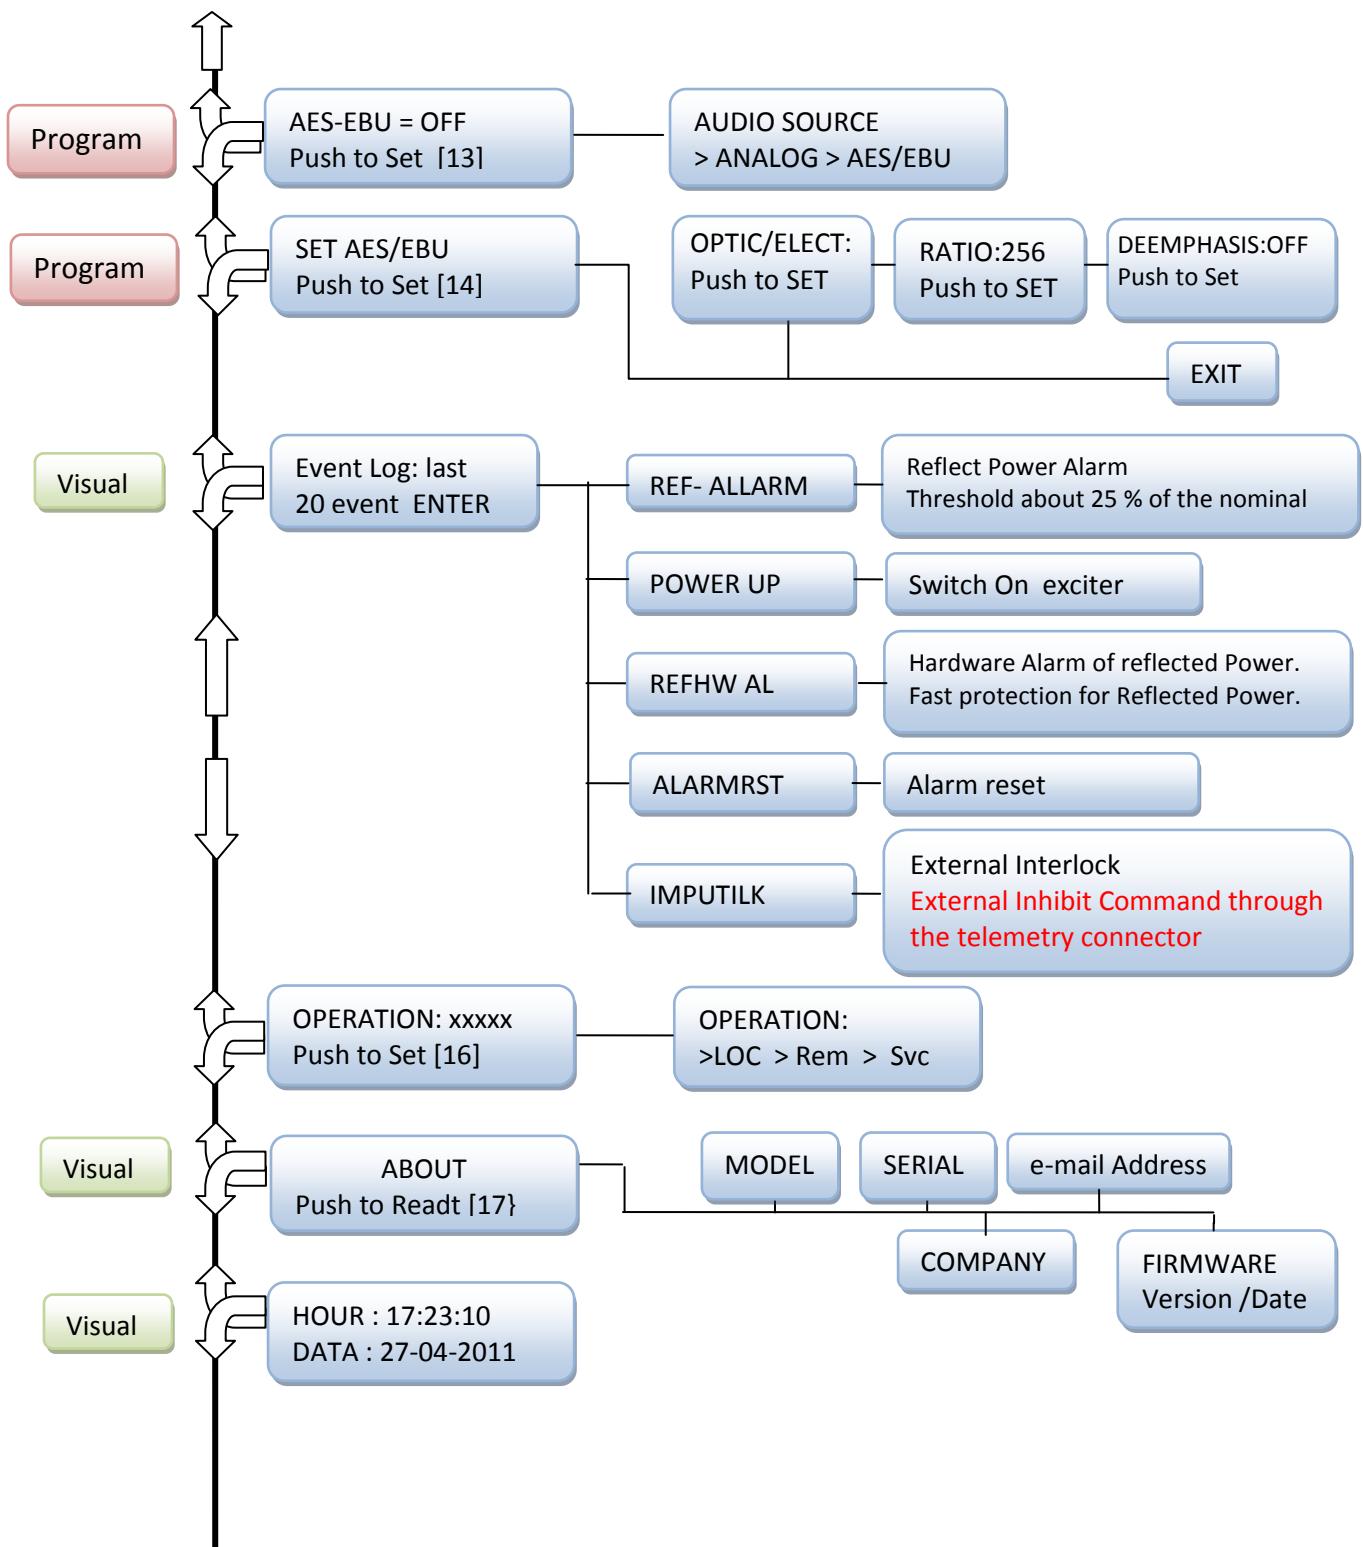

Flow chart Encoder Knob

Firmware 2.24D

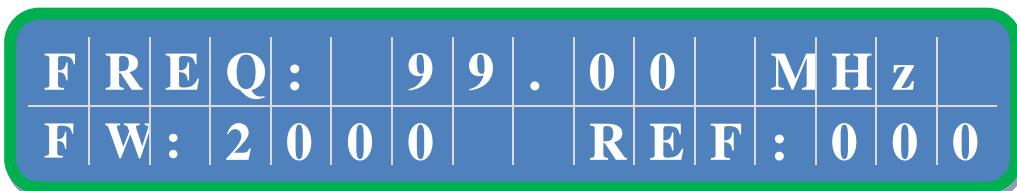

Switch On

After installation procedure execution, proceed to the following operations described below. Detail instructions are present on this manual and will be recalled in the relevant chapter.

The first slide on display reads

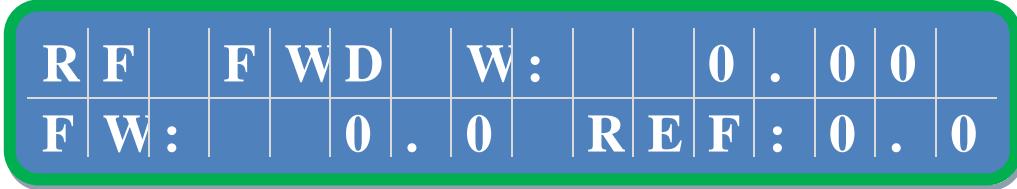

The PLL (Phase Locked Loop) starts the lock-in process which takes 4-5 sec. approximately (depending on the frequency) to capture the oscillator at the programmed frequency

Very Important Notice!

After the PLL locks RF power ramps up to the programmed value. If you want to reset the previously stored value of RF power you must switch OFF the transmitter. After that, **switch ON** and **simultaneously** keep the knob pressed. In this particular case the RF power is forced to 0 W and the first slide is (see: "Special Mode Program")

The slide can set the desired RF power by rotating the encoder. Move cursor under YES to confirm and close the power setting by pushing the encoder knob

When selection is made

The microcontroller stores data in the flash memory and value is set

Setting Memories

Our software stores all parameters in seven different memories from M1 to M7. Only one memory at a time is active and can control the transmitter.

All operating parameters or any other value such as power output or audio sensitivity can be stored in any of the seven memories.

The programming operation does not affect the active (working) memory. When data setting is completed data can be saved.

All data will be changed simultaneously if you activate a memory other than the one previously in use. Memory status is indicated by a green/yellow LED

Default memory (Memory 1) is indicated by first LED starting from top.

From memory setting MENU shown in display you can select a different memory (from Memory 2 to Memory 7 via encoder knob or by remote control).

Each selected memory is indicated by corresponding LED.

The switching of a yellow LED shows which memory you are loading. Loaded memories are recalled by using memory activation menu in which case LED for active memory becomes green.

If modified data is saved in the active memory change will be operational when programming is completed (data is stored and program mode is closed).

RF output power control has two (2) different operating modes.

- First to program RF power in the active memory. You enter the desired power value which changes in real time.
- Second to program power in a non active memory. You enter power value and value is stored and becomes operational when memory is activated.

Memories can be activated in three different ways:

- Via the Encoder Knob as explained
- Via the DB25 rear connector (Exciter in “remote” mode)
- Via web interface option if it is present (Exciter in “remote” mode)

Section 2

VISUAL MODE OPERATION

Various Menus

Visual mode is designed to allow readings of numerous important parameters of the Exciter and power amplifier.

It is possible to visualize parameters and other stored data without making changes while Exciter is operating normally.

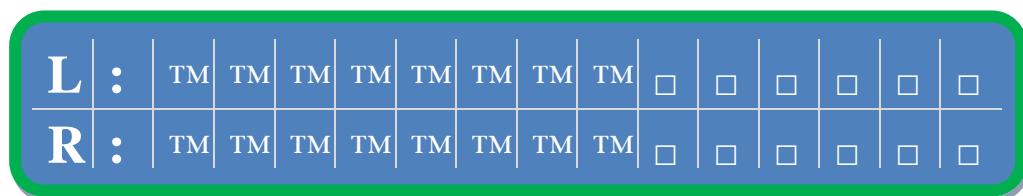

Visual mode is intended for consultation only and therefore described first in the sequence Visual/Program/Special modes.

To ensure optimum reading the LCD is placed in the central section of the front panel, it contains two rows holding sixteen characters and visualizes the information listed below by simply rotating the encoder.

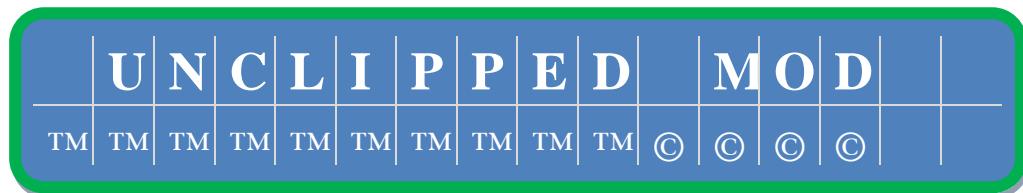

Audio Reading Pages

The Audio menu shows the slides described below.

Left & Right bars show peak modulation. The ten filled square blocks indicate 10% each (7.5KHz) of the permitted deviation (75kHz).Four empty blocks show over-modulation

2) Unclipped Modulation

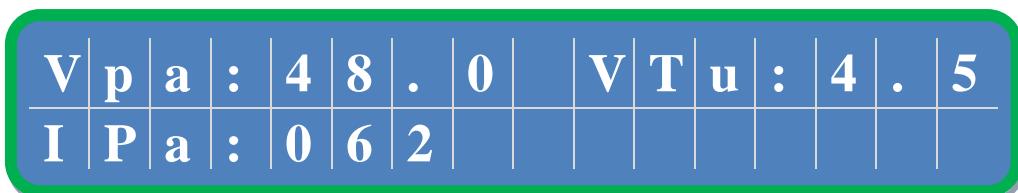

Other Parameter Reading Menù

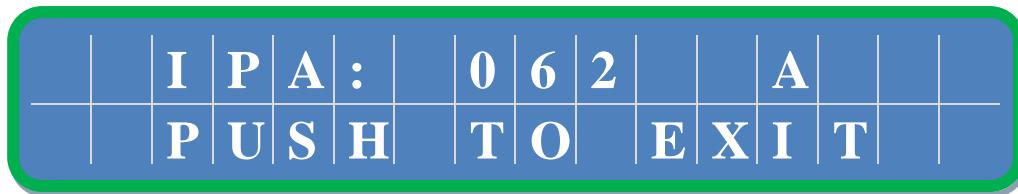

3) TEMPERATURES of the Ambient and RF STAGE

1) VPA-APC-IPA

This is the voltage that controls the PLL in order to stabilize the frequency. A value between 2 and 4V can be accepted. A typical value is 3.3 to 3.6V.
 Values out of specified range indicates a possible failure.

It indicates the current absorbed from the RF power stage. IPA current is the result of the driver and the power amplifier supply consumption. The RF driver section absorbs approx. 300mA. To evaluate the final amplifier current you must simply subtract 300mA from the total IPA current

The nominal current is as follow:

IPA @ 1000W is 30A

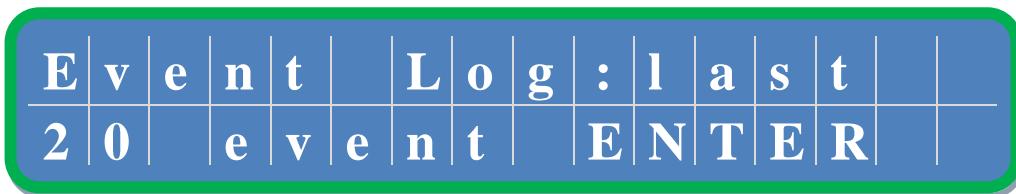

IPA @ 2000W is 60A

To exit slide push encoder knob and the following slide indicates menu is being shut

Event Log Reading Menù

The following slide shows the log of 19 event last

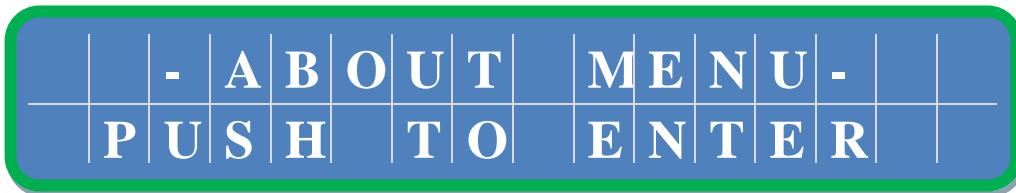

Event name	Description	Type	Notes
REF-ALARM	Reflected Power alarm	Alarm event	Threshold about 10 % of the nominal power
POWER-UP	Switching-on of the exciter	Simple event	
REFHW AL	Hardware Alarm of Reflected Power	Alarm Event	Fast protection for Reflected Power. This event type is available since the firmware release 1.43
ALARMRST	Alarm reset	Simple event	
RFT ALARM	Temperature alarm of the RF block	Alarm Event	>90°C
INPUTILK	External Interlock	Simple event	External Inhibit Command through the telemetry connector on rear panel part

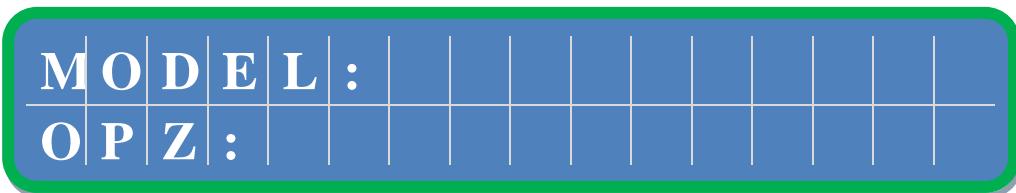

The transmitter goes in fault state and it is blocked, when the alarm events are 20. In the fault state do the alarm reset and, if the problem remains, remove the cause of the problem.

"About" Slides

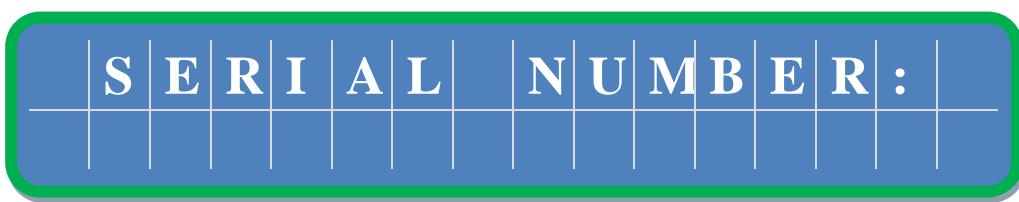

Turn encoder knob to find the ABOUT MENU which contains various slides with general information on Amplifier's Model, Serial number, Manufacturer's address, Firmware version, Website and Email address

scrolling down shows MODEL and installed optional parts

Serial Number

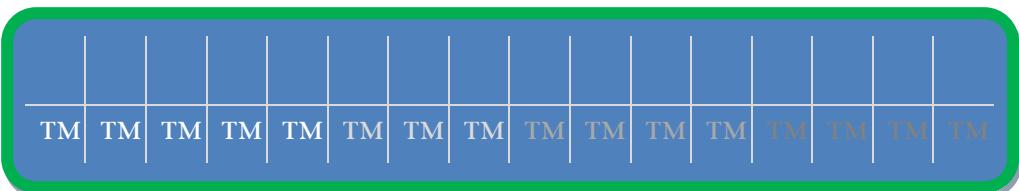

Firmware Version and date

To exit return to main menu and push as indicated below

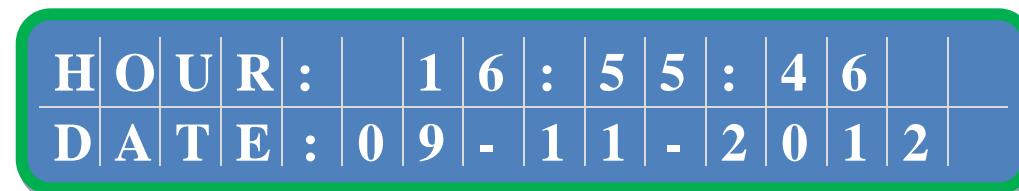

When exit is selected the following slide indicates menu is being shut

Date Hour Reading Slides

Hour and date is shown in this slide

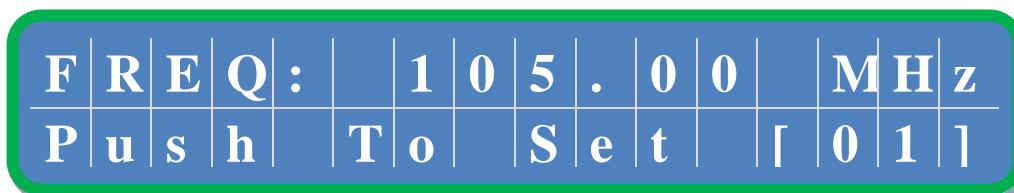

Section 3

PROGRAM MODE OPERATION

Frequency Setting.[01]

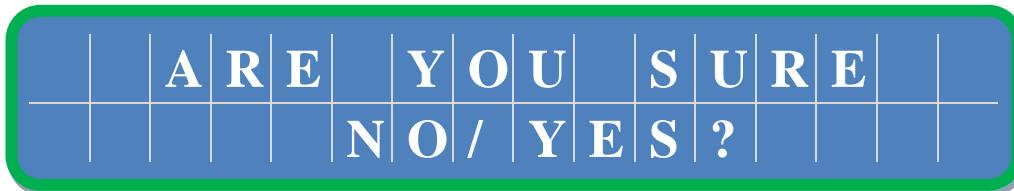

Rotate encoder knob to find slide to program frequency. Push encoder knob as indicated

Slide below shows current frequency at 105.00 MHz. Value can be modified when cursor moves under relevant characters. Turn encoder knob right or left to increase or decrease to set the wanted value

The range limits are: 87.50 MHz to 108.00MHz. The default step is 10kHz, but upon request, it is possible to choose different threshold values (i.e. 25 or 50 kHz). Confirm new value and exit routine by pushing the encoder knob

Cursor highlights **NO** selection by default to prevent pushing the encoder knob and enter a mistaken value

To validate your change move cursor to **YES** selection and press encoder knob, or move cursor back to **NO** selection to reject setting

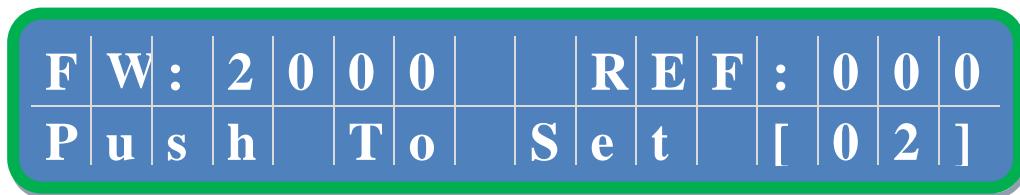

Each time a **YES** selection is made the following slide appears, or if no change is made programming is exited

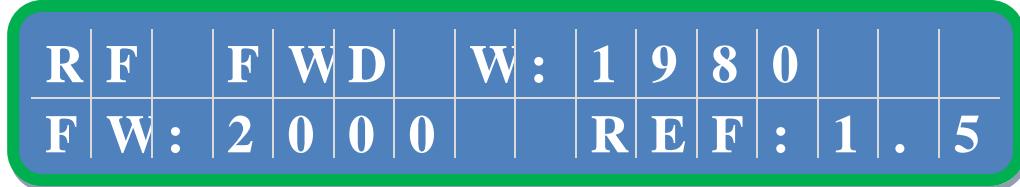

The microprocessor stores new data in the memory and selected value is active

RF Power Slides.[02]

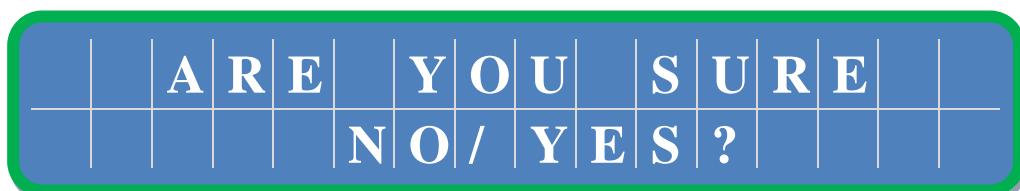

To program RF Power output rotate the encoder knob to find slide below. Follow instructions to push encoder knob to enter program mode

The first slide on front display reads the information below

Turn encoder knob right or left to increase or decrease value as required
Confirm selected value by pressing encoder knob and following slide appears

Cursor highlights **NO** selection by default to prevent pushing the encoder knob and enter a mistaken value

To validate your change move cursor to **YES** selection and press encoder knob, or move cursor back to **NO** selection to reject setting.

Each time a **YES** selection is made the following slide appears, or if no change is made programming is exited

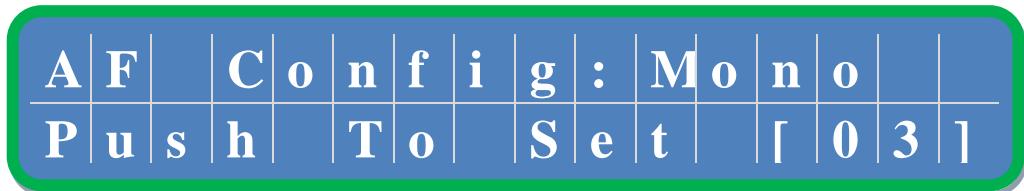

The microprocessor stores data in the memory and selected value is active

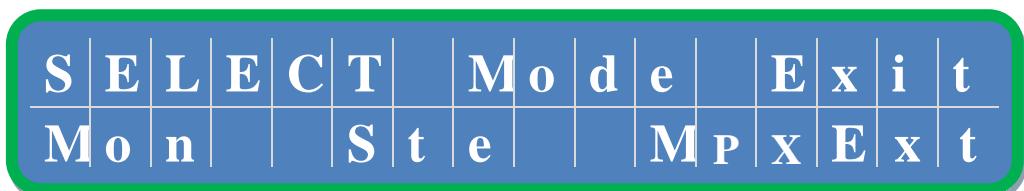

Audio Setting [03]

1) Audio Modulation

The following slide shows the stored Mod-in

Press the encoder knob and the following slide is shown

Select Modulation MONO, STEREO or MPX Ext;

Confirm selected mode by pushing the encoder knob.

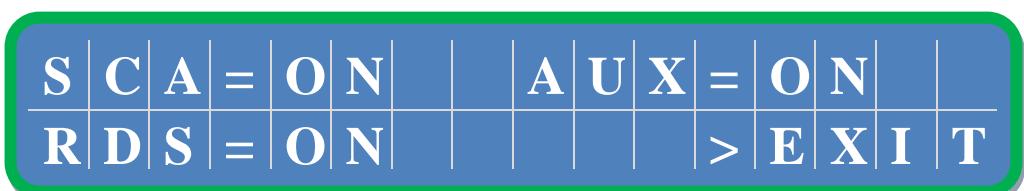

To validate your change move cursor to **YES** selection and press encoder knob, or move cursor back to **NO** selection to reject setting

Each time a **YES** selection is made the following slide appears, or if no change is made programming is exited

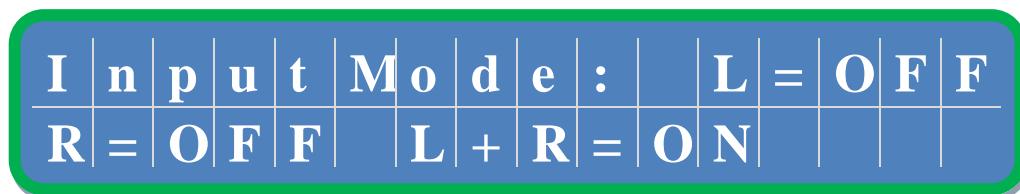

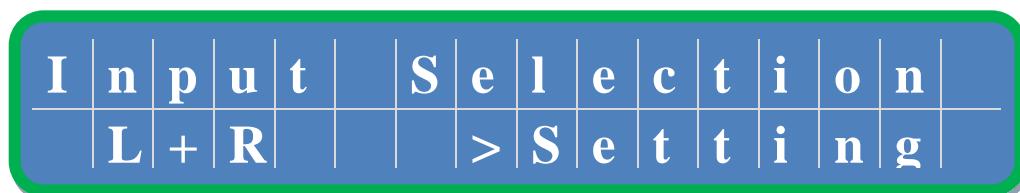

The microprocessor stores new data in the memory and selected value is active

The following slide to select the status (ON / OFF): SCA or RDS AUX

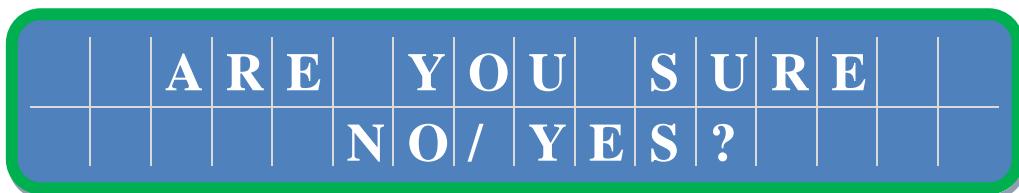

2) Audio Input Selection

Slide is ready by the following inputs to be enabled

Placing the cursor in the wanted selection and change the status from ON to OFF and vice versa.

If you place the cursor "<" and press the encoder, the latter changes state and becomes ">", then you can press forward with the choice

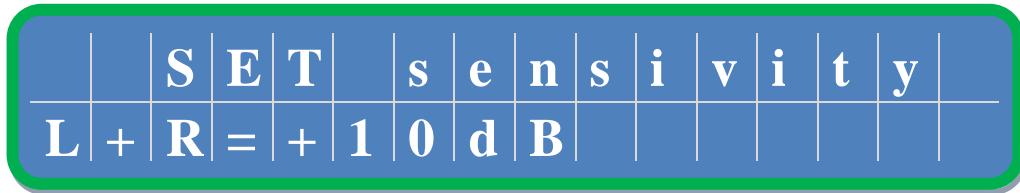

yes or no to continue

Sensitivity [04]

The following slide shows stored Sensitivity value and consequently "on air". This slide is also the access point to set or program Sensitivity value

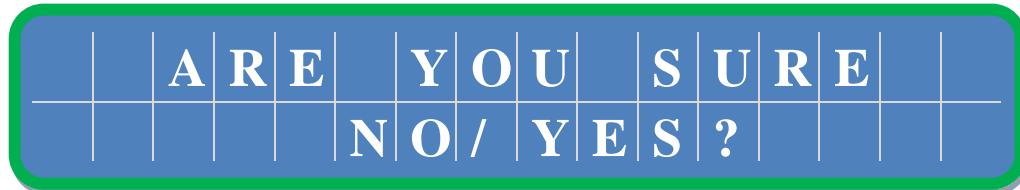

Press encoder knob and the following slide is shown

If you rotate the encoder will see the following selections: **L + R, Left, Right, MPX, AUX1, SCA, RDS**, where each may select the sensitivity. See table AUDIO INPUTS

Exit, or close and confirm new value by pushing the encoder knob

Cursor highlights **NO** selection by default to prevent pushing the encoder knob and enter a mistaken value

To validate your change move cursor to **YES** selection and press encoder knob, or move cursor back to **NO** selection to reject setting.

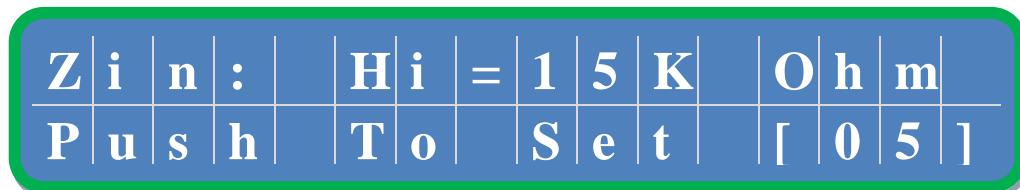

Each time a **YES** selection is made the following slide appears, or if no change is made programming is exited

The microprocessor stores the new data in the memory and selected value is active

Input Impedance [05]

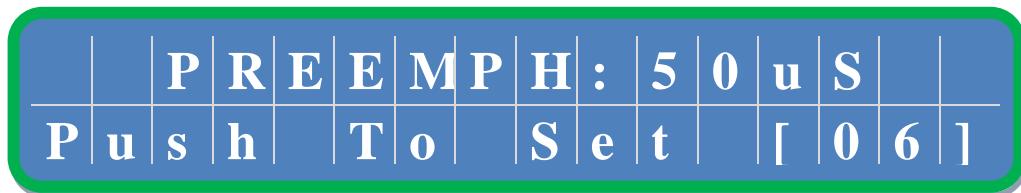

Slide is ready by the following inputs to be enabled

Exit, or close and confirm new value by pushing the encoder knob

Pre-Emphasis Settings [06]

The following slide shows the storedPre-emphasis value and consequently “on air”. It is also the access point to the slide for setting the Pre-emphasis value

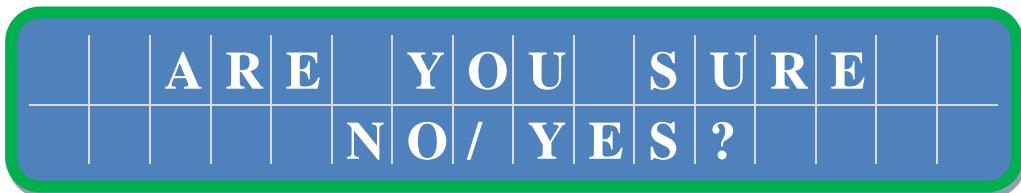

Preemphasis is set at 50 uS. Push as indicated and the following slide is shown

Turn encoder knob to increase or decrease value. Set the Pre-emphasis value to 50uS, or 75uS or Linear (Excluded pre-emphasys network).

Exit, or close and confirm new value by pushing the knob

To validate your change move cursor to **YES** selection and press encoder knob, or move cursor back to **NO** selection to reject setting

Each time a **YES** selection is made the following slide appears, or if no change is made programming is exited

The micro stores the new data in the memory and new value is active

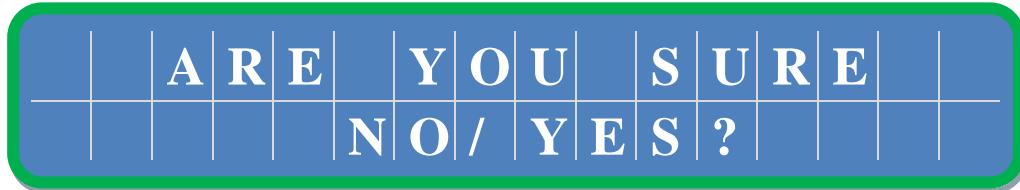

Limiter Setting [07]

The following slide shows the LIMITER status and how to switch ON or OFF as required

PUSH TO ACTIVATE

To enter new value press encoder knob, move cursor to YES selection to accept or NO to reject selection

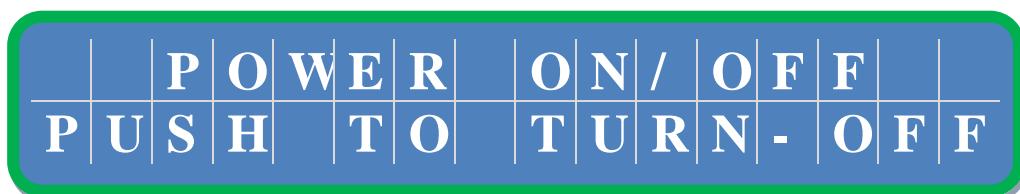

If YES is selected following slide is

The microprocessor stores new data in the memory and new Limiter status is activated

POWER ON/OFF

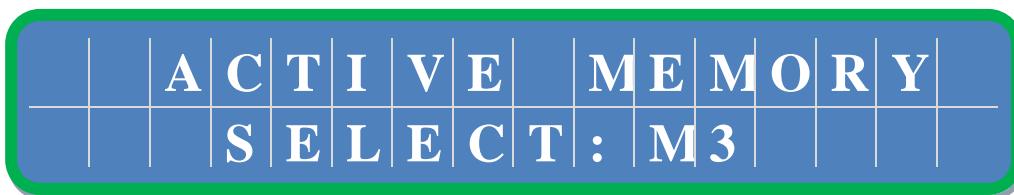

The following slide shows the LIMITER status and how to switch ON or off as required

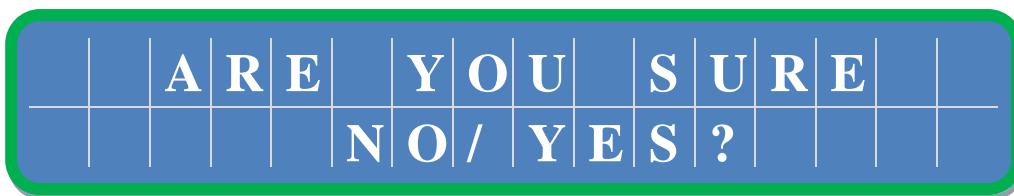

In this section you can switch-ON or OFF the RF output of the exciter (No perceptible residual RF is present on spectrum).

RECALL/ SET e Memory [9]

To activate the parameters stored in a different memory of the transmitter select the **ACTIVE MEMORY** menu as shown in the following slide

Turn the encoder knob to select a specific memory and confirm selection as usual. Move cursor to YES selection and press encoder knob

If YES selection

New data is stored

Memory Setting [10]

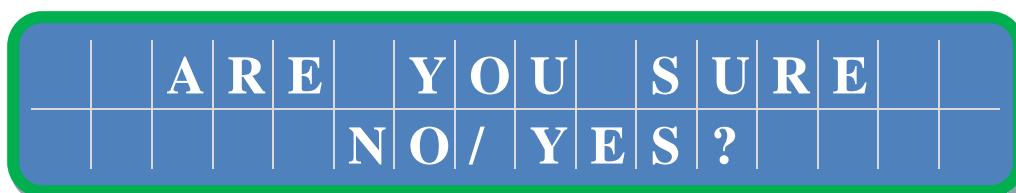

To program the different memories of Transmitter you must enter the SETTING MEMORY menu, as shown in the example below

Press encoder knob and the slide displays

Turn encoder knob to select the memory to program. Pushing the encoder knob to access the “setting state” which is indicated by the (yellow) front panel LED switching on. All selected parameters such as Frequency, Power, Audio, Address, etc can be set up and stored in the chosen memory

Slide above shows how to confirm as usual and below the micro loads new data

Note:

If you are in SETTING MEMORY only the slide for programming is displayed;
To activate a memory you must exit the SETTING MEMORY menu

This is a very important slide:
please pay attention to slide because it indicates:

1. Which memory successive data will enter (“MEMORY SET”)
2. Which memory must be set as operational for current configuration

Presetting [12]

Setting Menu refers to a some specific settings. Push the encoder knob to program the following settings

P	r	e	s	e	t	t	i	n	g				
P	u	s	h	T	o	S	e	t		[1	2]

1) LOCAL/REMOTE Operation

The following slide shows current mode of operation

O	P	E	R	A	T	I	O	N	:	L	o	c	a	l
P	U	S	H	T	O	P	R	O	G	R	A	M		

Push encoder knob to program new mode of operation

		O	P	E	R	A	T	I	O	N				
>	L	o	c		>	R	e	m		>	S	v	c	

move cursor to select Local, Remote or Svc (Service)Operation as required. Push encoder knob to program.

In every selection and subsequent appears increasingly choosing "ARE YOU SURE"

Choose with cursor and press to confirm to No or to Yes, and Loading slide appears.

				L	O	A	D	I	N	G				
TM														

		A	R	E		Y	O	U		S	U	R	E	
		N	O	/		Y	E	S	?					

All remote commands via RS485 or via telemetry commands connector (DB 25) are disabled when the exciter is set in “local” mode. Otherwise they are enabled when the exciter is set in “remote” mode and all settings by menus are disabled except for this menu.

2) Normal Open\Normal Closed INTERLOCK

The following slide shows the currently stored “Interlock” status

I	N	T	L	C	K:	N	o	r	m	O	p	e	n
P	U	S	H	T	O	P	R	O	G	R	A	M	

Push encoder knob to program new data and slide shown is

I	N	T	E	R	L	O	C	K	N	o	r	m	a	l
>	O	P	E	N	>	C	l	o	s	e	d			

Turn encoder knob to select Normal Open or Normal Closed operation for Interlock. Move cursor to YES selection and press to confirm. New data is stored as usual.

For Stand-Alone device INTERLOCK is setting on **Normal Open**

3) POWER GOOD

This value determines the minimum level for RF output power considered to be good. A value below this preset threshold causes the transmitter to fail. The slide below shows the “Power good” value currently stored

P	O	W	E	R	G	O	O	D:	N	o	n	e
P	U	S	H	T	O	P	R	O	G	R	A	M

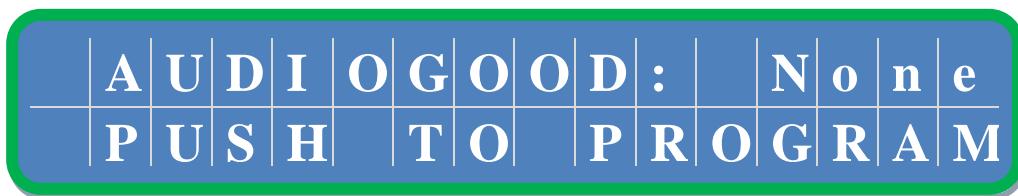

Push knob to program value and the following slide is

T	H	R	E	S	H	O	L	D:	N	o	n	e
P	U	S	H	T	O	P	R	O	G	R	A	M

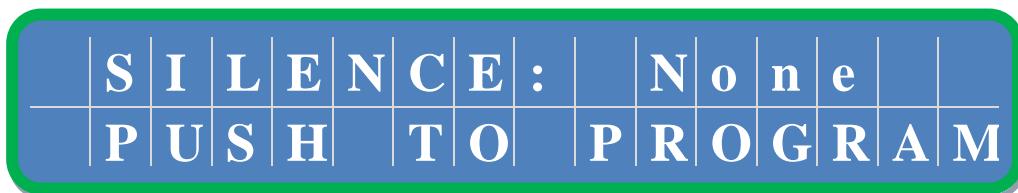

Turn the encoder knob to select and set value for power good. Move cursor to YES selection and press to confirm. New data is stored as usual

4) AUDIO GOOD

The following slide shows the “Audio good” value currently stored

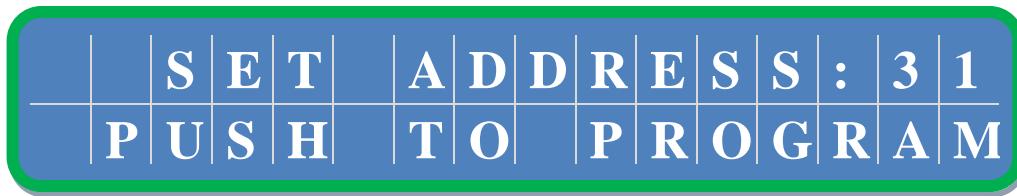

Push encoder knob to program required value and the slide appearing is the following

Turn encoder knob to select desired value of audio good. Move cursor to YES selection and press to confirm. New data is stored as usual

5) SET ADDRESS

The following slide shows the address assigned to equipment; address (00) is default address assigned by manufacturer. This function allows equipment to be identified and addressed when included in a Network because each Transmitter is identified by address assigned

Push encoder knob to program a different address

Turn the encoder knob and a specific 2-digit address can be set and saved in memory. The usual confirmation and storing procedure. The correct address for stand-alone use is “00”. When the TCP/IP optional telemetry interface is mounted, the right address is “31”.

6) CODE Source

C	o	d	e	:	-	-	-	-	-	O	F	F	
P	U	S	H		T	O	P	R	O	G	R	A	M

(-	-	-	-	-)	O	F	F			
S	A	V	E				E	X	I	T	>	

Type in the CODE. Then move the cursor to select and press to confirm

7) 19 KHz Source

The following slide shows 19KHz Source:

1	9	K	H	z	S	o	u	r	c	e	:	I	N	T
P	U	S	H		T	O	P	R	O	G	R	A	M	

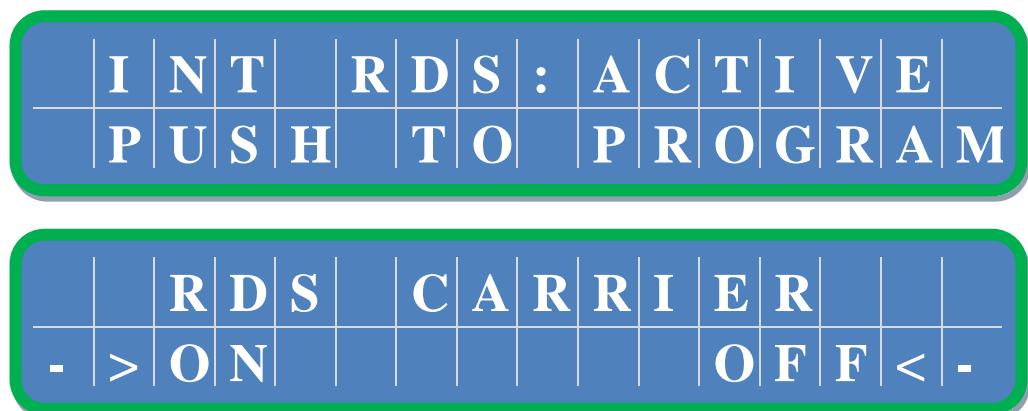

1	9	K	H	z	S	o	u	r	c	e			
-	>	I	N	T					E	X	T	<	-

Move the cursor to select and press to confirm. New data is stored

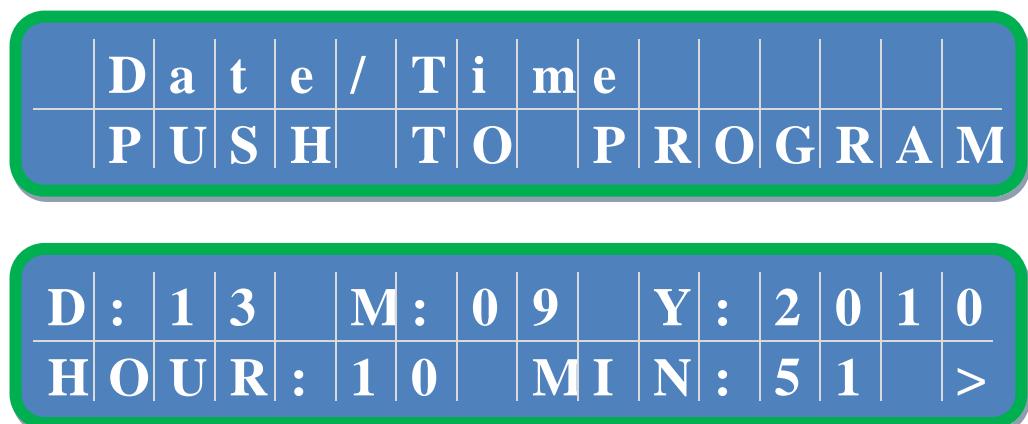

8) AGC Source (MUST BE SET “INT”)

A	G	C	S	o	u	r	c	e	:	I	N	T	
P	U	S	H		T	O	P	R	O	G	R	A	M

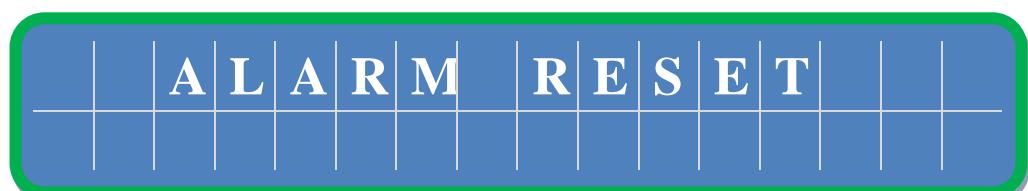

A	G	C	S	o	u	r	c	e					
-	>	I	N	T					E	X	T	<	-

9) INT RDS (Optional)

Enable/disable the optional RDS internal encoder when is present.

10) DATE TIME

to Move the cursor ">" push encoderknobto programNew data is stored

11) ALARM RESET

In this section you can reset the alarms that contribute to lock the device

11) ALARM RESET

A | L | A | R | M | | R | E | S | E | T |

When an alarm reset is made, the alarm events remain in the menu “LAST 20 EVENTS”

Digital AES/EBU (option)

The following slide shows

A | N | A | L | O | G | / | A | E | S | | E | B | U |
P | u | s | h | | T | o | | S | W | i | t | c | h |

press encoder knob to select between the analog or optional digital (AES/EBU) audio input

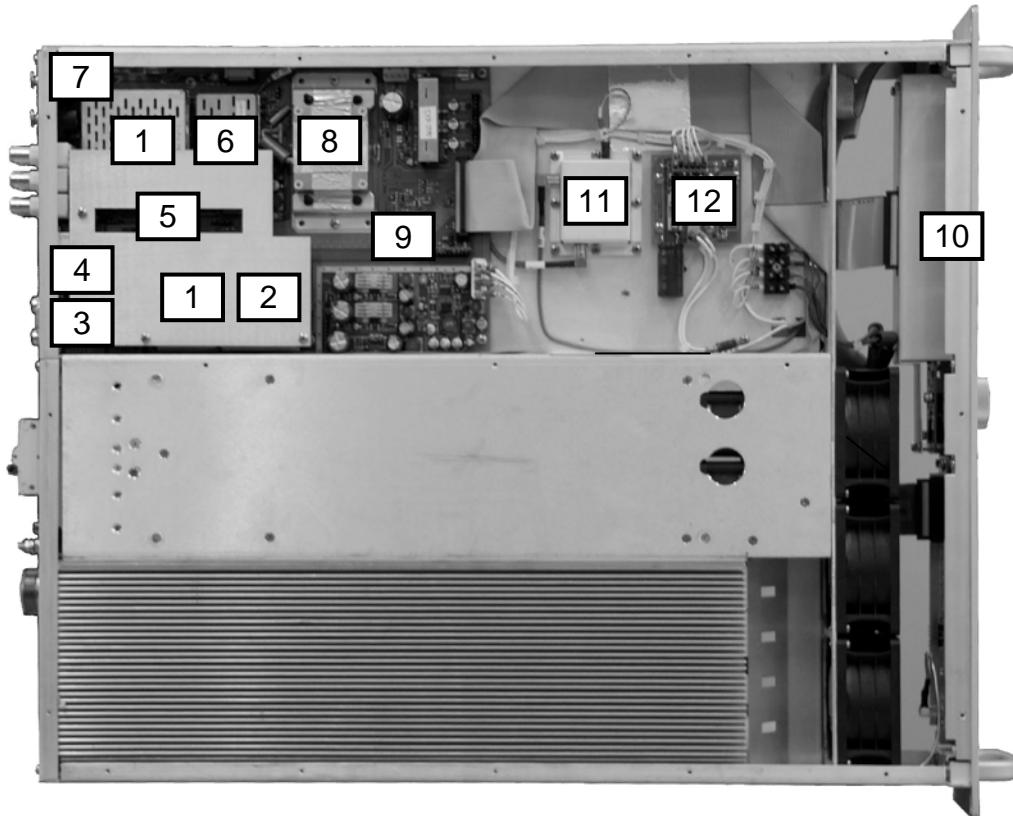

S | E | T | / | A | E | S | | E | B | U |
P | u | s | h | | T | o | | E | N | T | E | R |

General description

The **2kW RF Amplifier Section**, is designed for the VHF band II FM power amplification process, this unit employs latest generation solid state LD-MOS gold-plated transistor technology in order to obtain reliability and high efficiency. It operates as a wideband amplifier over the full frequency band.

The LD-MOS transistors utilised operate in B class, each RF block amplifier is easy replaceable without any soldering and alignment, it comprises circuits for stabilising the operating point and monitoring (temperature, current etc.).

The cooling system is performed with forced air by means of the high performance DC fans with electronically commutated external rotor motor, the commutation electronics fully integrated inside the fan's body. The suitable mechanical structure, fully integrate, provides to convey the fluid toward the RF module heat-sink and power supply section.

The Fig.1 shows the simplified block diagram. The input power is applied via two way splitter to the output final RF stages than combined by the RF output coupler and low-pass filter for the harmonics suppression, the circuit involves also the directional couplers for RF monitoring, measurement and SWR protection

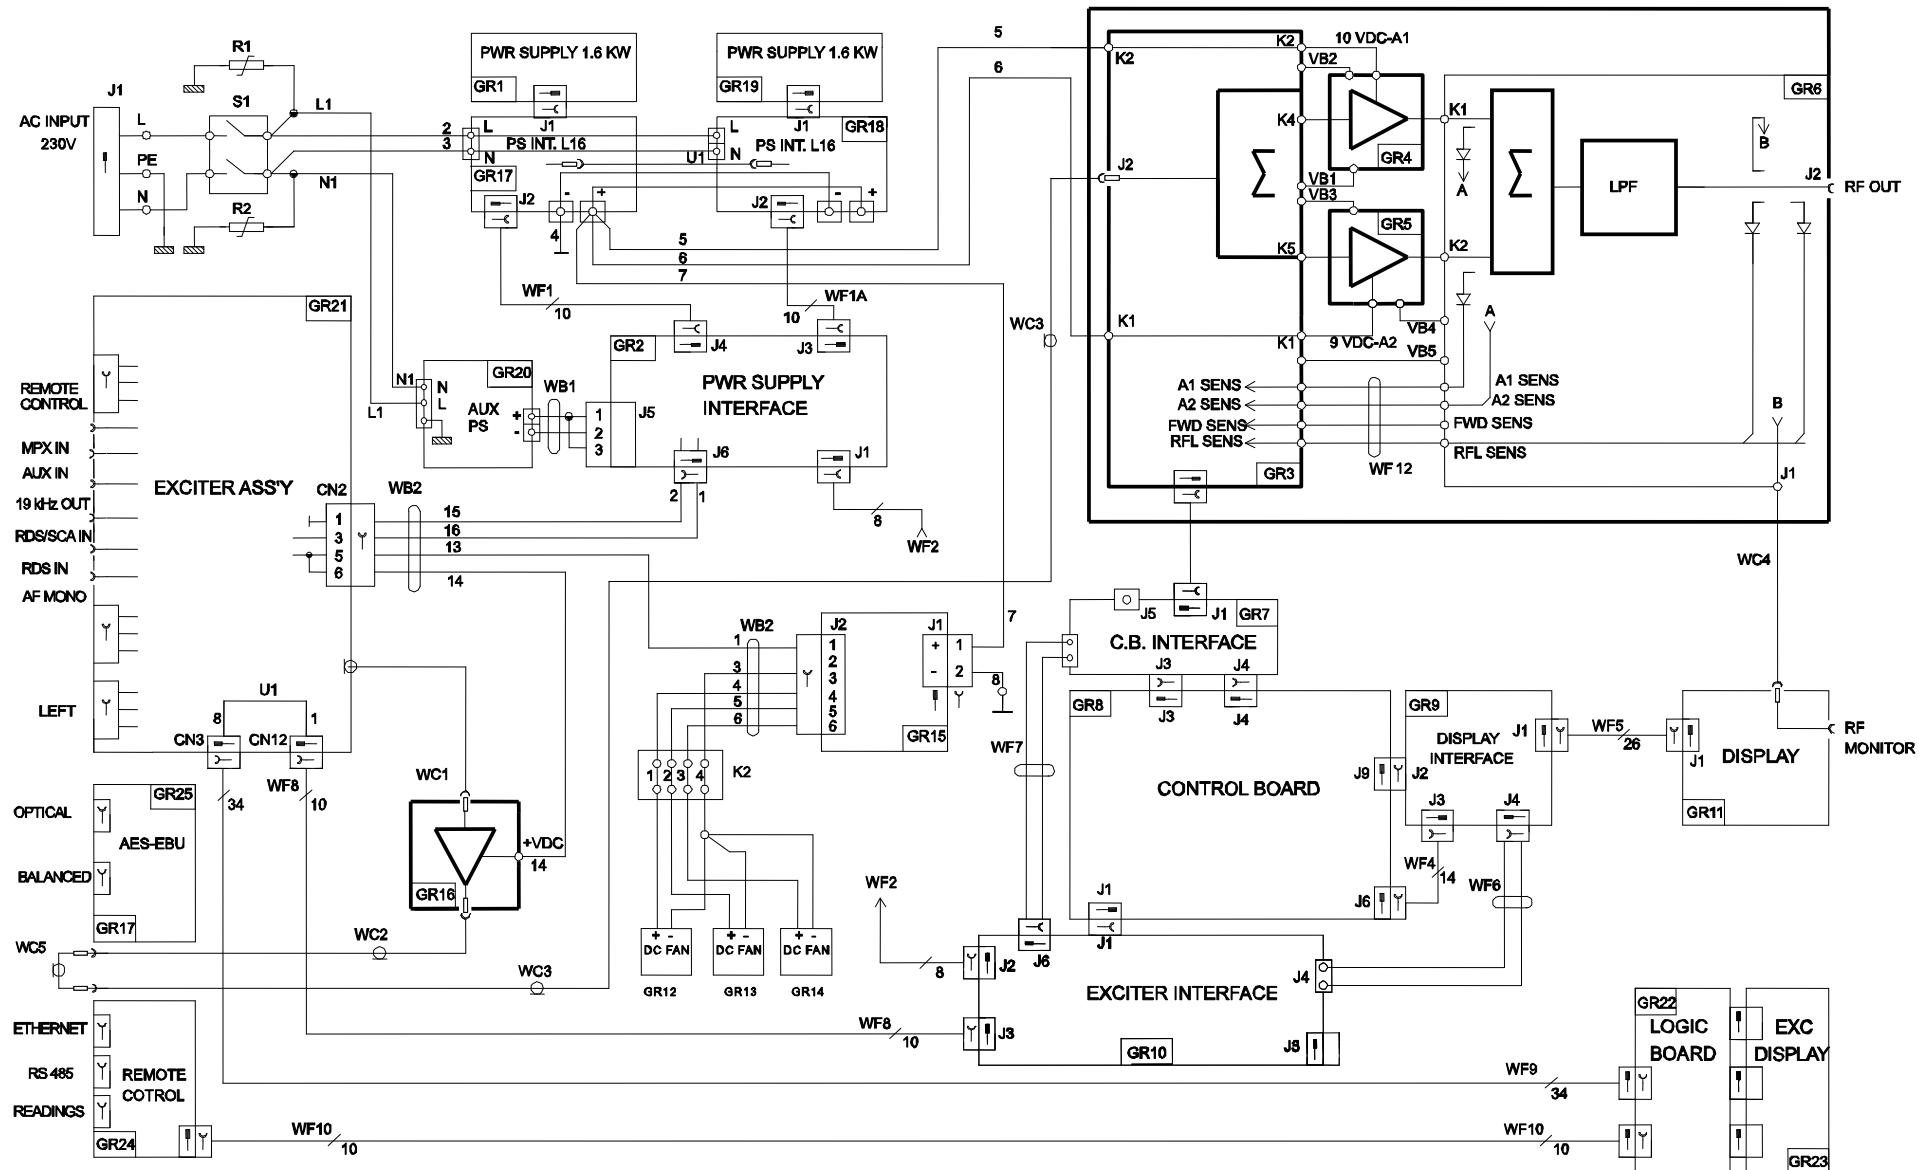

Fig. 1 2kW RF Amplifier Section - block diagram

- **Block diagram description**

RF Control Driver (driver stage)

The RF signal coming from the exciter is applied to the input circuit , this one provides to the following signal processes before amplification:

- First amplification
- RF input monitoring
- Power input detection
- Overdrive protection
- Power gain adjustment
- RF switch-off

Driver stage includes only one device capable of 50 W RF output ; in order to obtain reliability and high performances, the normal power rating is reduced up to 25 W.

Two Way splitter

The circuit provides to distribute the RF to the final stage , the signal is divided in two way and then applied to the two RF Block.

RF block (Pallet final stages)

The board is the RF amplifier basic block including LD-MOS devices, bias circuit a amplifier consists in a "push-pull" stage coupled by means of the combining system fully integrated in the RF block.

Two Way coupler and Low Pass Filter

The unit provides to combine two RF signals coming from the final stages, it includes also the absorber resistor in order to keep a good matching and high isolation in case of the partial final stage failure.

The RF power output path includes the low-pass filter for the harmonics suppression, it is realised with silver plated inductors and microstrip capacitors to be resistant to the RF high voltage.

The group includes two directional coupler for RF power output and reflected RF power monitoring. and SWR protection circuit .

Control Board Interface

The board collects the parameter signals coming from the sensor installed in the RF module and after the process it provides to enable the RF and power supply circuits , furthermore the status is represented on the DISPLAY BOARD accessible from the front panel.

The fig. 5 shows the signals flow block diagram.

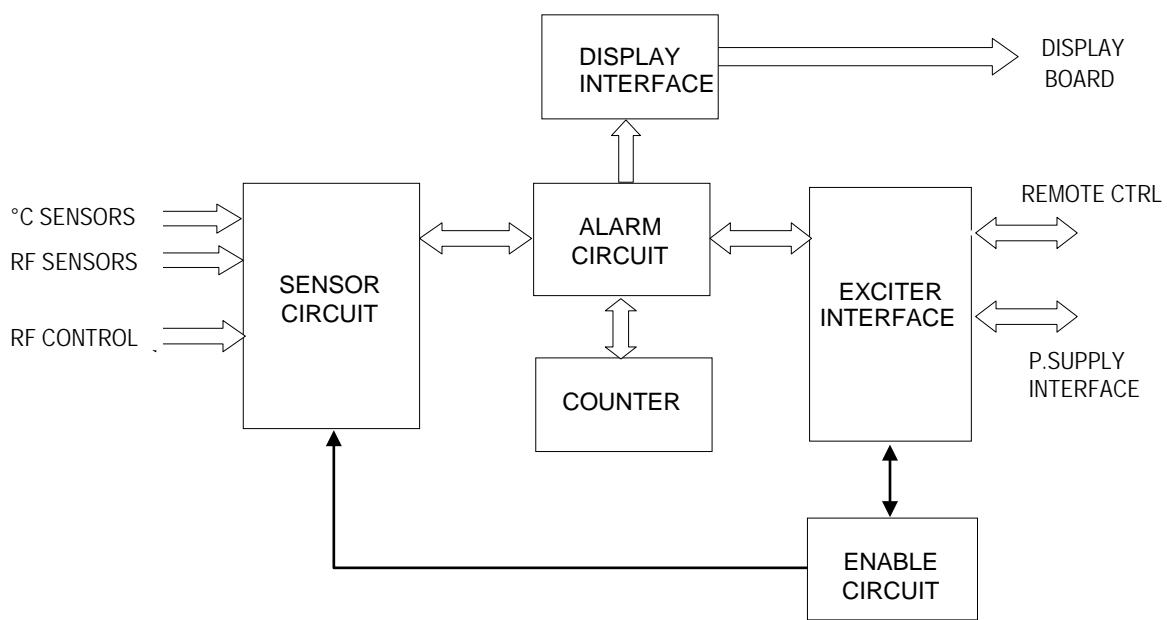

Fig. 5

The sensor signals coming from temperature detectors, RF differential detectors and RF control circuit are sent to the **sensor circuit** that provides to digital signal conversion.

The **alarms circuit** receives the information's from the sensor circuits and remote enable control , then the logic signals processed are sent to the display board and remote interface.

The **counter** provides to generate the BLOCK signal after a programmed number of the alarms occurred .

The **display driver** provides to collect the input and output signals present to the front panel display board, as LED's indication and commands.

The **exciter interface** circuit provides to collect all signals in digital form and by means bus sends to the computerised Control Unit.

The **enable circuit** drives the RF CONTROL and AC/DC POWER SUPPLY in base of the instruction presents and alarm circuit.

Display Board

The board mounts the LED and pushbutton for display monitoring , ALARM RESET, and STANDBY COMMAND (some version) on front panel , the driving signals are coming from CONTROL BOARD INTERFACE via cable.

Temperature sensor

The circuit includes two thermistors mounted along the heat-sink for the temperature monitoring, the signal are sent to the CONTROL BOARD INTERFACE.

Front Panel Display - Fig. 6

Nr	Label	Description
1	P.SUPPLY	MAINS red LED which indicates a failure of VAC mains voltage input , as out-range values or missing phase
		PSU red LED which indicates a failure occurred to the AC-DC power supply module
		I max red LED which indicates a current overload present to the power supply unit.
2	RF PALLET	DRIVER red LED which indicates a failure to the RF driver module named PA0
		1 2 red LED's which indicate a failure to the relevant RF basic modules (Pallet) named as: “1” referred to PA1 “2” referred to PA2
3	ALARM	BLOCK red LED which indicates a block of the machine due to five tentative of alarms restoring failed. The alarms called for are: <ul style="list-style-type: none"> • SWR Standing Wave Ratio (output mismatch $\geq 1:2$) • $^{\circ}\text{C}$ Heat sink Temperature (≥ 70 degree)
		SWR red LED which indicates presence alarm
		$^{\circ}\text{C}$ red LED which indicates presence alarm

4	STATUS	RF green LED which indicates the RF ON AIR , when RF level reach $\geq 30\%$ of the nominal max value,
		ENABLE green LED which indicates the apparatus activated and ready to working normally
		ON green LED which indicates the machine TURN-ON and AC Mains Voltage present
5	STANDBY	Push-button provided to disable the RF Output
		Yellow LED which indicates STANDBY status
6	RF MONITOR	RF MONITOR 50 Ω BNC female connector for monitoring of RF output signal present . Level 10 dBm ± 3 dB referred to max nominal RF
7	RESET	RESET push-button provided to reset all memorized alarms occurred after restoring procedure failed
8	-----	AIR INLET GRID provided of removable air dust filter

General Description

The power supply unit is installed aside from RF section and is realized by independent AC/DC modules easy accessible .

The AC/DC module has an individual protection against over-current, over-voltage and temperature , so that any failure occurred cause only a reduction of RF power , without service interruption.

The high tolerance mains voltage ($\pm 20\%$) is accepted, so that in most situations, the Automatic Voltage Regulator is not necessary.

Each AC/DC power supply provides 48 VDC up to 1600W for the RF power amplifier, an auxiliary 15 VDC AC/DC is utilized for services circuit .

The unit is designed to satisfy the following requirements

- Active Power Factor Correction
- Active AC Inrush limit Control
- High Efficiency up to 90%

Electrical features (Single Module)

• Input :	Vin = 230Vac, $\pm 20\%$ (48 ÷ 62 Hz)
• Output MAIN:	I _{max} = 16A @230Vac 32÷48 Vdc $\pm 1\%$
• Output AUX:	I _{max} = 60A 15Vdc $\pm 1\%$
• Operating temperature:	I _{max} = 1A –10 ÷ +45°C, non derating
• Storage temperature:	–20°C ÷ +65°C
• Max relative humidity:	95% RH
• Efficiency @ 100% load:	90 % (worst case)
• Power factor:	> 0.98
• Hold-up time (load 100%) :	20 msec
• Peak Inrush current:	<15A @230 Vac
• Switching frequency:	30 ÷ 70 KHz
• Ripple V MAIN	<0.5Vpp
• Ripple V AUX	<0.1Vpp
• Insulation voltage (input/output):	1,5KV@50 Hz, 60sec
• Insulation voltage (input/GND):	1,5KV@50 Hz, 60sec
• Insulation voltage (output/GND):	0V (Out– to GND)
• MTBF:	>800.000 h (T. amb. +25°C)

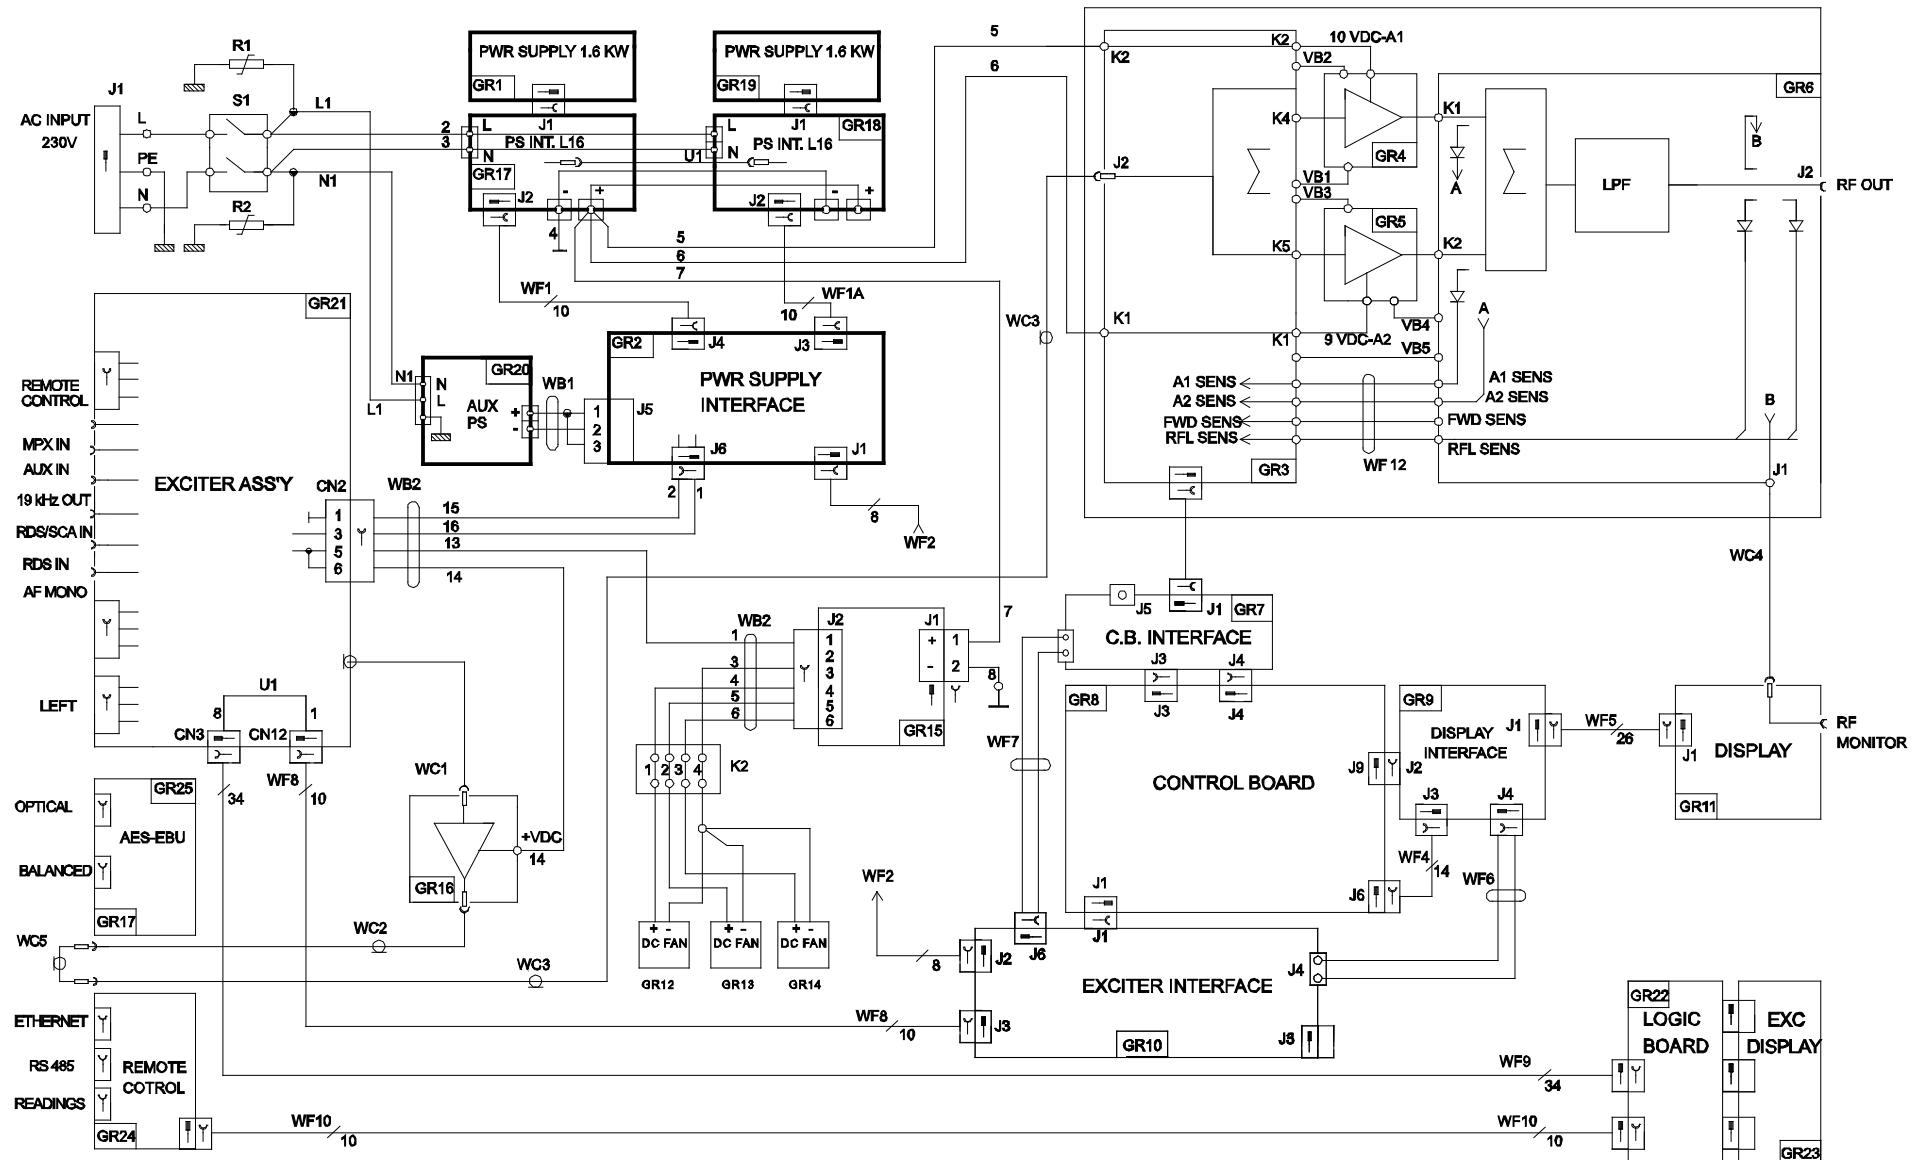

Fig. 1 AC/DC Power Supply Unit - block diagram

- **Functional Description (see Fig. 1)**

The AC Mains Power applied to J1 connector feeds the GR20 auxiliary power supply and , through the GR17 and GR18 interfaces, the two power supplies (GR1 and GR19) , by means mains breaker S1 which turn the amplifier ON/OFF and it is supplied with a thermal trip release for overcurrent protection.

The overvoltage protection is realized with discharger arresters that provide a voltage cut-off at 275V between AC wires and AC wires to ground.

WARNING 208 - 240 VOLTAGE

The AC Power must be applied by suitable cables

The two AC/DC Switching Power Supplies powered by the Mains Power Voltage through pertinent connector generates a DC voltages of 48V 3.2 kW and the auxiliary Power supply a 15VDC 1A.

The GR2 “Power Supply Interface” board provides to following functions:

- Power Supplies Output Voltage Control
- Power Supplies Inhibit Control
- Voltage Monitor
- Current Monitor
- Overload and Overtemperature Alarm

The controls are allowed by means of J3/J4 connector linked with WF1/WF1A cables through Power Supply module GR1/GR19. Table 2 shows the pin-out signal.

The auxiliary +15VDC, coming from the Power Supply is sent through WB1 cable to the connector J5 of the GR2. The auxiliary +15VDC output is then present to J6 for Exciter FM modulator (when present in some version) and auxiliary circuits. The pin-out is shown in Table 3

The GR2 allows the complete management of the AC/DC Power Supply by means J1 connector linked via WF2 to GR10 “Exciter Interface” board. The Control Signal and pin-out of J1 is shown in Table 1.

Table 1

■ Features :

- Universal AC input / Full range
- Protections: Short circuit / Overload / Over voltage / Over temperature
- Cooling by free air convection
- LED indicator for power on
- 100% full load burn-in test
- No load power consumption<0.5W
- All using 105°C long life electrolytic capacitors
- Withstand 300VAC surge input for 5 second
- High operating temperature up to 70°C
- Withstand 5G vibration test
- High efficiency, long life and high reliability
- 3 years warranty

	AC CURRENT (Typ.)	0.35A/115VAC	0.25A/230VAC			
PROTECTION	INRUSH CURRENT (Typ.)	COLD START 65A / 230VAC				
	LEAKAGE CURRENT	<2mA / 240VAC				
	OVERLOAD	Above 105% rated output power Protection type : Hiccup mode, recovers automatically after fault condition is removed				
	OVER VOLTAGE	3.8 ~ 4.45V	5.75 ~ 6.75V	13.8 ~ 16.2V	17.25 ~ 20.25V	28.4 ~ 32.4V
	OVER TEMPERATURE	U1 Tj 140°C typically (U1) detect on main control IC Protection type : Shut down o/p voltage, recovers automatically after temperature goes down				
ENVIRONMENT	WORKING TEMP.	-20 ~ +70°C (Refer to "Derating Curve")				
	WORKING HUMIDITY	20 ~ 90% RH non-condensing				
	STORAGE TEMP., HUMIDITY	-40 ~ +85°C, 10 ~ 95% RH				
	TEMP. COEFFICIENT	±0.03%/°C (0 ~ 50°C)				
	VIBRATION	10 ~ 500Hz, 5G 10min./1cycle, period for 60min. each along X, Y, Z axes				
SAFETY & EMC (Note 6)	SAFETY STANDARDS	UL60950-1, TUV EN60950-1 approved				
	WITHSTAND VOLTAGE	I/P-O/P:3KVAC I/P-FG:2KVAC O/P-FG:0.5KVAC				
	ISOLATION RESISTANCE	I/P-O/P, I/P-FG, O/P-FG:100M Ohms / 500VDC / 25°C / 70% RH				
	EMC EMISSION	Compliance to EN55022 (CISPR22) Class B, EN61000-3-2,-3				
	EMC IMMUNITY	Compliance to EN61000-4-2, 3, 4, 5, 6, 8, 11, EN55024, EN61000-6-1, light industry level, criteria A				
OTHERS	MTBF	1608.8Khrs min. MIL-HDBK-217F (25°C)				
	DIMENSION	62.5*51*28mm (L*W*H)				
	PACKING	0.13Kg; 108pcs/15Kg/0.71CUFT				
NOTE	1. All parameters NOT specially mentioned are measured at 230VAC input, rated load and 25°C of ambient temperature. 2. Ripple & noise are measured at 20MHz of bandwidth by using a 12" twisted pair-wire terminated with a 0.1uf & 47uf parallel capacitor. 3. Tolerance : includes set up tolerance, line regulation and load regulation. 4. Line regulation is measured from low line to high line at rated load. 5. Load regulation is measured from 0% to 100% rated load. 6. The power supply is considered a component which will be installed into a final equipment. The final equipment must be re-confirmed that it still meets EMC directives. For guidance on how to perform these EMC tests, please refer to "EMI testing of component power supplies." (as available on http://www.meanwell.com)

ISTRUZIONI DI MONTAGGIO

Inserire nell'ordine: vite TC/I M3, Rondella piana M3, distanziale cilindrico. Tenere bloccato il tutto con un dado esagonale M3 acciaio inox. Saldare la testa della vite, la rondella e il distanziale con il circuito stampato. Svitare il dado inox M3.

ISTRUZIONI DI MONTAGGIO

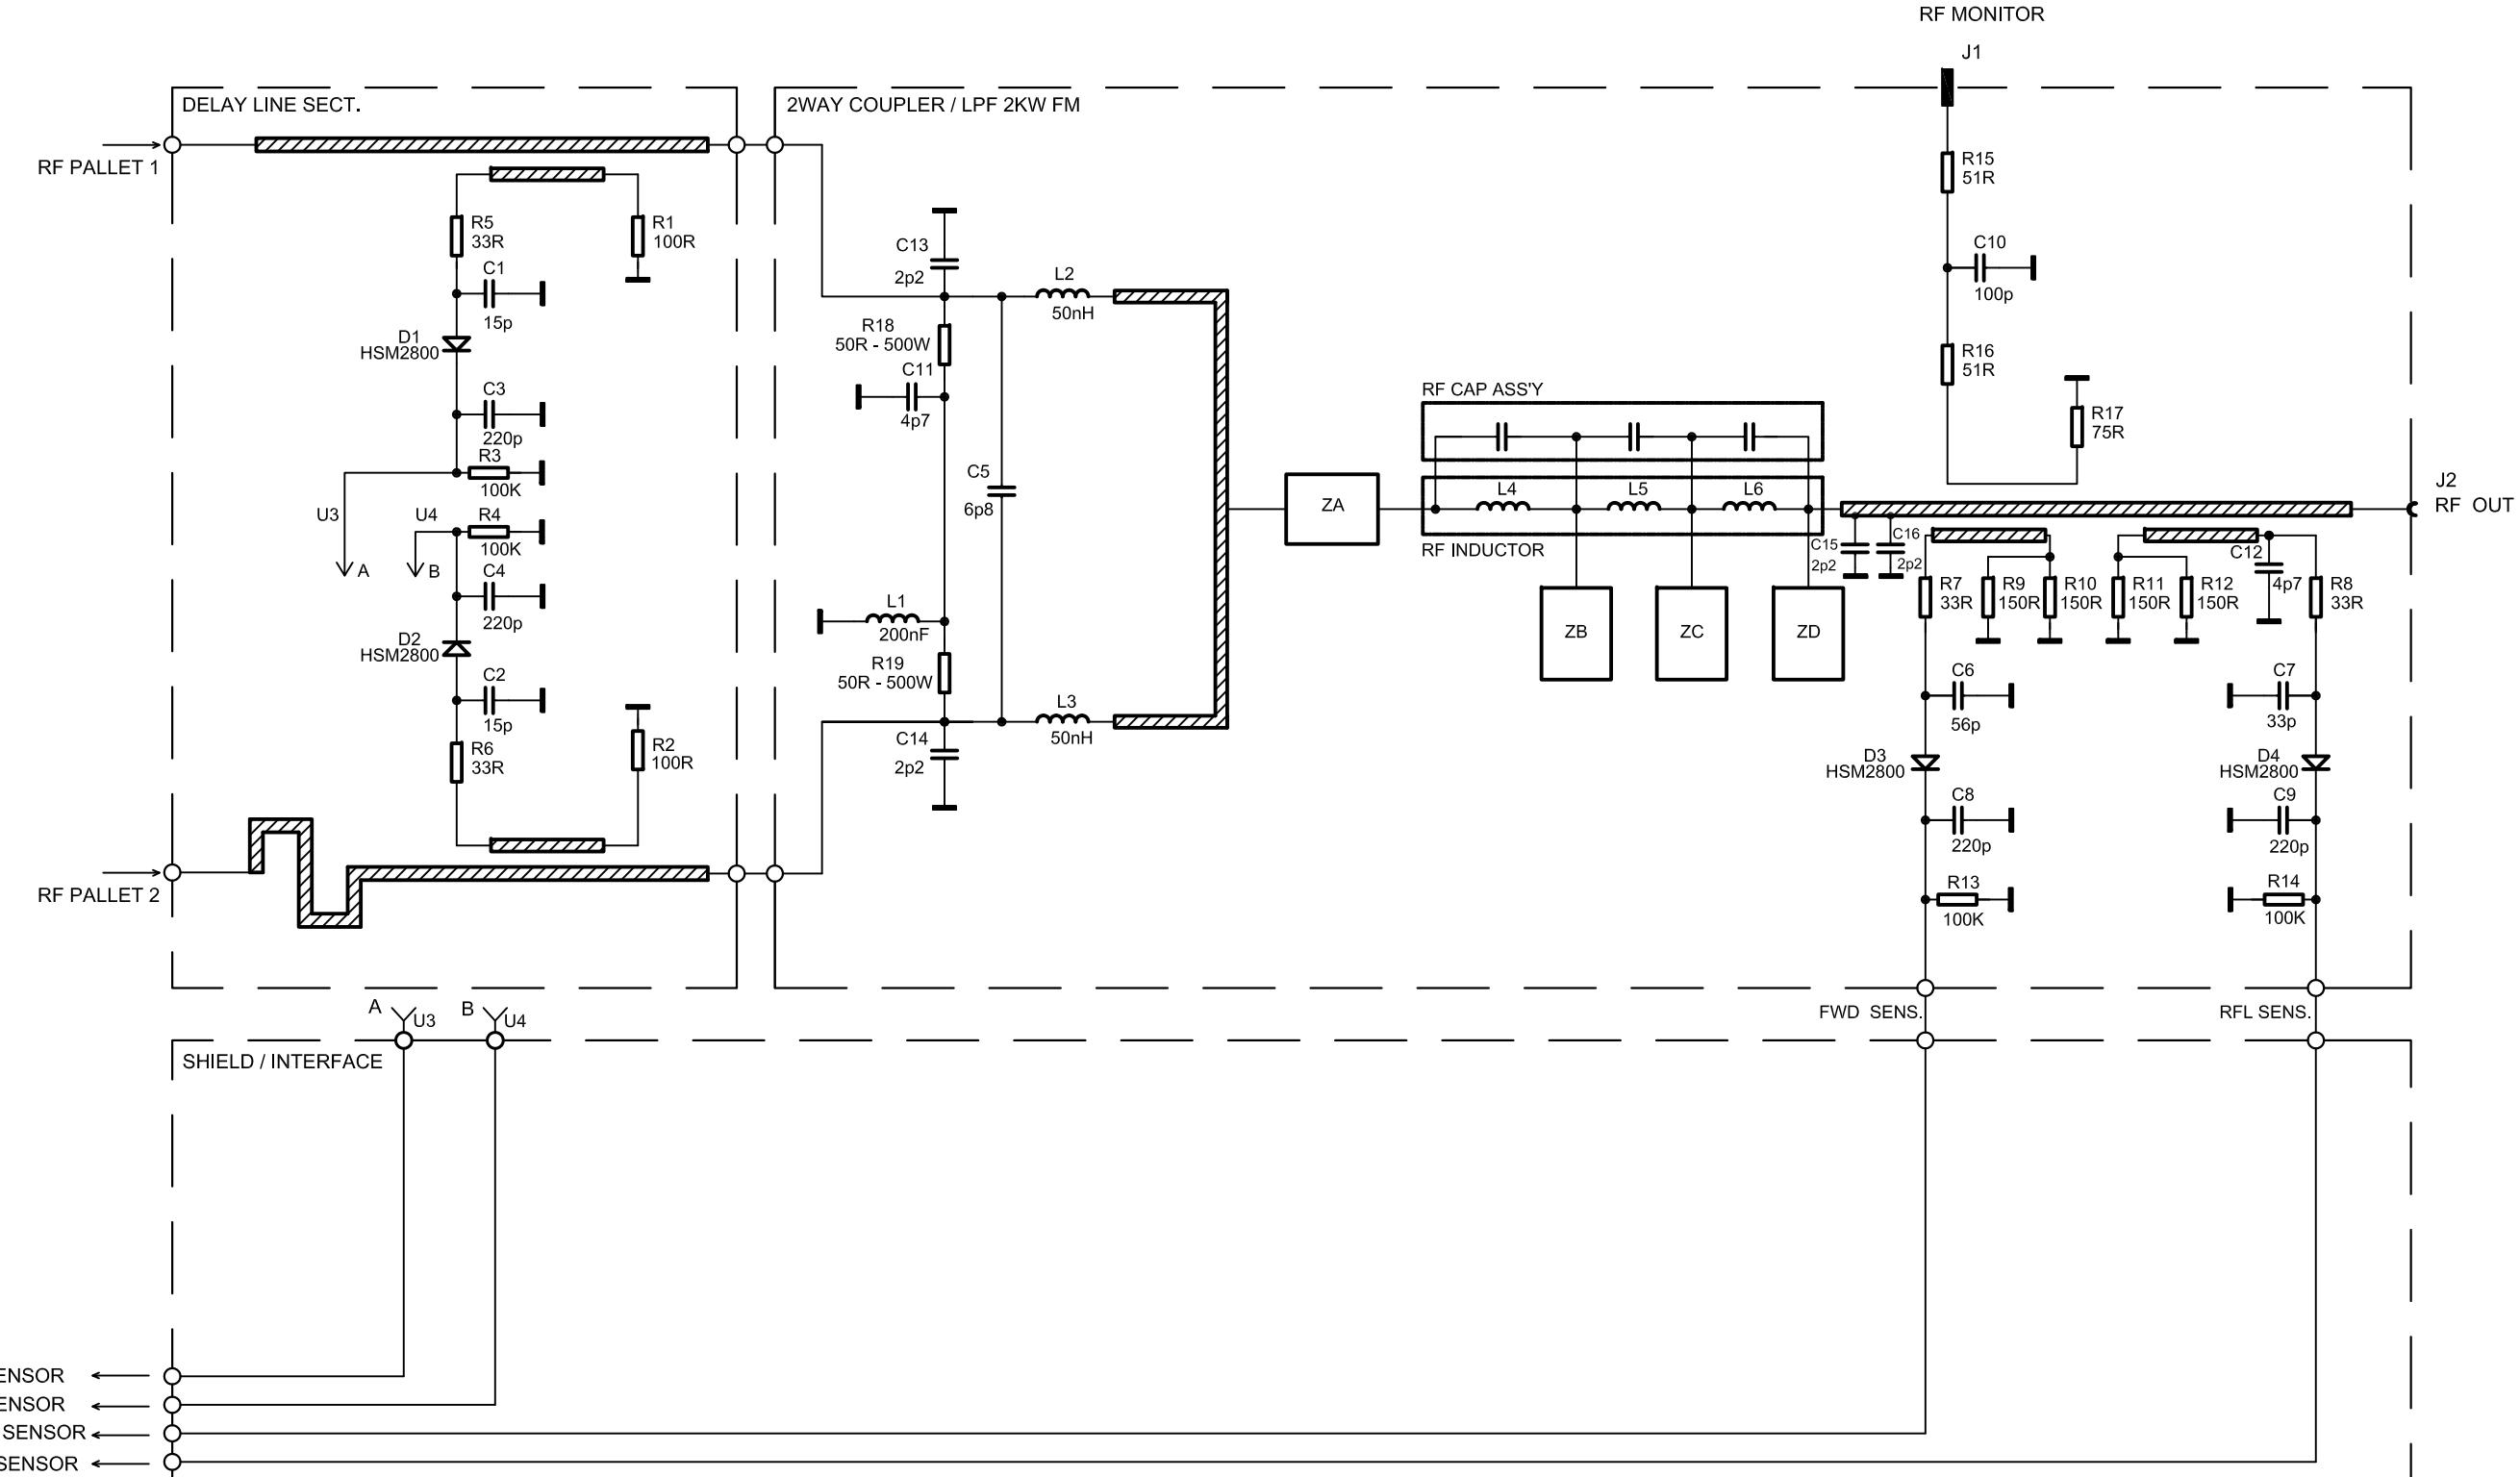

Inserire le viti TC/I M3 e quindi avvitare un dado su ciascuna vite. Saldare le teste delle viti e i dadi con il circuito stampato. Avvitare il secondo dado.
